LABOR LEGISLATION, Foreign. Two basic and antithetical tendencies may be noted in modern foreign labor legislation. One trend is typified by the vast body of statutes and administrative enactments which form the greater part of the social legislation (q.v.) of most countries and an important factor in the political and social reform of capitalist society. Labor legislation of this type is intended to improve the position of labor by curbing industrial autocracy and enlarging the social responsibilities of the state. Its best exemplification, with respect both to its historic origin and development, is the labor legislation of the United Kingdom.

The second trend is manifested in legislation restrictive of the activities and rights of labor. Such legislation is enacted in democratic countries when antilabor forces are in the ascendant, and in national emergencies. This tendency is most fully realized in the labor laws of totalitarian dictatorships, as, for example, the labor laws of the fascist governments of Italy and Germany, which were annulled following the defeat of the Axis powers in World War II, and the labor codes and decrees of the Soviet Union, which, in substance, were extended after the war to other countries.

British Labor Legislation.—Modern British labor legislation originated during the Industrial Revolution (q.v.) which transformed the United

Kingdom from an agrarian country into the first modern industrial nation. It was enacted in response to a clamorous demand for the elimination of a number of shocking abuses arising from the growth of the factory system. It preceded and influenced the labor legislation of other countries. The pioneer act of British labor legislation is generally believed to be the Health and Morals of Apprentices Act,¹ adopted by Parliament in 1802, which limited the hours of work of the indentured apprentices; it did not apply to other child laborers.

Its enactment marked the advent of humanitarianism as a motive of labor legislation, as virtually all previous statutes relating to the relationship of employer and worker were framed in accordance with the feudal concept of master and servant, and were designed to insure the subjection of labor. Notable English laws of this type of earlier times were the Statutes of Labourers, enacted from the reign of Edward III in the 14th century to that of Queen Elizabeth in the 16th century. Pre-eminent among later antilabor legislation were the Parliamentary enactments, known as the Combination Acts or Laws.²

The Health and Morals Act had little effect on child labor. Not only was it limited in scope, but no serious effort was made to enforce it. Moreover, the number of possible beneficiaries of the act was decreasing at the time the measure was adopted as employers found a cheaper source of labor in children who lived at home and could be laid off at will. As the cruel exploitation of child labor continued, the demand for its limitation was intensified. Adult workers, especially miners and textile workers, who also were cruelly exploited, made a continuous protest against the industrial oppression under which they and their children suffered. Strikes, riots, incendiarism in mills and factories, and the destruction of machinery (see LUDDITES) signified their hatred of their oppressors and their demand for humane treatment.

Under mounting social pressure, Parliament enacted in 1819 the first of a long series of measures called collectively the Factory and Workshop, or merely the Factory, Acts. The law of 1819 established a minimum age of nine years for child workers in cotton mills and limited the workday for those under 16 years of age to 12 hours. In 1824, Parliament repealed the Combination Acts and legalized trade unions; and, although this freedom was considerably circumscribed by an enactment adopted in 1825 and prosecutions of unions as conspiracies under the common law were conducted for years, trade unions continued thereafter to maintain a legal and effective existence. The Truck Act of 1831, the predecessor of two other acts of the same name adopted in 1887 and 1896, initiated policies whereby the payment of wages in coin of the realm was made compulsory, contracts requiring workers to spend their wages in a particular manner or place were rendered illegal, and the

imposition of arbitrary fines by employers was eliminated. A measure further limiting the workday of child laborers, enacted in 1833, is generally regarded as the first effective factory act. It provided for the first time for inspectors with power to enter the premises of manufacturers to which the law applied, for the purpose of determining whether employers were complying with the act. The employment of women and children below ground in mines was prohibited in 1842 by a statutory enactment which also provided for the appointment of government inspectors of mines. In 1844, Parliament established 12 hours as the maximum workday for women and children in textile mills. A maximum workday of ten hours for women and child textile workers was legislated in 1847, but was successfully circumvented in consequence of adverse judicial interpretation. Picketing was legalized in 1859.

In the period from the middle of the 19th century to World War I, the United Kingdom became the leading industrial and financial power of the world. The inception of free trade in 1860 demonstrated the paramount influence on government policy of the doctrine of *laissez faire* (q.v.). The equal right of all men, as individuals, to enter into contractual relationships—freedom of contract—was proclaimed as a fundamental principle of social existence.

Nonetheless, as industry, finance, and commerce prospered, individual enterprises grew into monopolies and cartels, and employers formed associations to advance their interests. Large numbers of workers began to perceive that the doctrine of legal equality was a two-edged sword. For, if on the one hand, it seemed to strike at surviving effects of the feudal legal concept of master and servant, it obscured, on the other hand, the fact that in the negotiation of individual labor contracts, employers were much stronger economically than workers. Increasing numbers of workers began to understand that the strict application to labor relations of the doctrine of legal equality led to gross economic and social inequality. Labor turned to trade unionism and legislation to limit the power of employers, achieve equality in bargaining power with them, and eliminate the inimical consequences of unrestricted freedom of contract.³

The labor laws of the period continued the earlier practice of protecting the weakest workers, but were more extensive in scope and applied to most phases of labor relations. However, they were, on the whole, supplemental to the determination by the unions, through strikes and collective bargaining, of hours, wages, and conditions of labor. By 1867, some measure of government control over factory conditions had been extended to almost all manufacturing industries, and a beginning had been made in the regulation of coal mines. A series of disasters led to the enactment in 1850 of the Coal Mines Inspection Act, which established minimum standards of ventilation and safety in collieries and provided for the inspection of coal mines. A code for the operation of coal mines was adopted in 1855.

¹ The apprentices to which the law applied were pauper children taken from almshouses and indentured for fixed periods of time to work in cotton mills. They were housed in barracks and were often compelled to work sixteen hours a day.

² These measures, adopted in 1799 and 1800, embodied the common-law doctrine of conspiracy, under which combinations of workers, formed to secure higher wages, shorter hours, or other improvements in the situation of labor, were punishable as criminal conspiracies. Under these laws, trade unions and strikes were illegal.

³ Labor was little influenced by revolutionary Marxist doctrines, but from the latter part of the 19th century when modern political working class parties were formed gave increasing support to reformist socialist ideas of gradual transformation of capitalist society into a cooperative commonwealth.

The Trade Union Act of 1871 prohibited the prosecution of labor unions as criminal restraints of trade. Under the Conspiracy and Protection of Property Act of 1875, the concerted acts of workers done in connection with a labor dispute could be prosecuted as a criminal conspiracy only if the acts were criminal when performed by individuals. The trend to remove labor disputes from the purview of criminal law was also manifest in the enactment of the Employers and Workers Act of 1875, under which breaches of contract between employers and workers generally became causes at civil law for suits for damages. But thirty years were to pass before the unions were freed by the Trade Disputes Act of 1906 from the lingering effects of the common-law doctrine of conspiracy and were exempted from suits for damages in connection with labor disputes. State regulation of labor relations in the merchant marine was begun in 1876 with the establishment of rules for the employment of seamen and their accommodation aboard ship; other subsequent acts were consolidated in 1894 and were followed by amendatory legislation in the 20th century.

As the 19th century came to a close, the scope of labor legislation was enlarged by two important measures—the Workmen's Compensation Act and the Conciliation Act—both enacted in 1896. The former law broadened existing policy by providing for compensation to workers for all injuries sustained by them in the course of their employment, for which they were not at fault, and, in cases of fatal injuries, for compensation to the workers' dependents. The Conciliation Act abolished compulsion in negotiating solutions of labor disputes and empowered the Board of Trade to promote settlements by conciliation or voluntary arbitration.

All existing factory acts were consolidated by the Factory and Workshop Act of 1901, which extended the scope of the legislation to docks and other industries, and strengthened the law's enforcement machinery; 11 years was set as the minimum age for child laborers in the industries to which the statute applied.

From 1908 to 1913, Parliament enacted a number of important laws. Noncontributory old-age pensions, paid by the government, were voted in 1908. In the same year, the Coal Mines Regulation Act established a maximum workday of eight hours for miners. This was the first statutory provision relating to the hours of work of adult male workers. The Trade Board Act of 1909 established a minimum wage in a number of trades employing principally women, and in the same year the Labour Exchanges Act provided for the establishment by the government of free employment agencies. Under the terms of the National Insurance Act of 1911, unemployment insurance was instituted for the first time. Provision was made in the Minimum Wage Act of 1912 for the joint establishment by miners and colliery owners of minimum wages. Political activity by unions was legalized in 1913. As the scope of state regulation of labor relations was broadened in the period before World War I, the administrative bodies created by the labor laws multiplied, and the enormous increase in the enactments made by these bodies gave labor legislation more and more of a nonparliamentary and predominantly administrative character. This development continued after the war.

During World War I further reforms were

legislated, notably in provisions for a minimum wage for agricultural workers, and for the establishment of minimum wages in trades in which persistent underpayment of workers was the rule. But in greater part the course of labor legislation was reversed during the war. A series of Munitions of War acts forbade strikes, provided for compulsory arbitration of labor disputes in industries producing for the war effort, and strictly limited the movements of workers in the war industries.

A brief period of postwar prosperity in the United Kingdom was followed by an economic depression, and the recovery which ensued proved to be only an interlude before the catastrophic worldwide depression of the 1930's. Large-scale unemployment began about 1921 and reached a peak of almost 3 million in 1931; until World War II, it was almost never less than a million. Among the measures taken by the government to cope with the depression were encouragement of rationalization in industry and of cartelization in industry and banking. In 1931-1932, it abandoned free trade and instituted protective tariffs on imports. From about 1937 the menace of Nazi Germany led to an increase in British armaments, and this stimulated production. But all of these measures were powerless to reverse the decline in British economic power which followed World War I.

In the interwar years, the working class was unable to make any substantial gains. Partly under the impact of the revolutionary tide emanating from Soviet Russia after World War I, accumulated discontent in the United Kingdom broke out in 1919 in the form of mutinies in the armed forces and sharp strike struggles. When, by 1920, these manifestations had ended in victory for the government and the employers, membership in labor organizations declined. Renewed industrial strife, which began about 1924 following recovery from the first postwar depression, led to the general strike of 1926. A sharp decline in the membership of working class organizations resulted from the defeat sustained by the workers in that struggle. A drop in food prices during the depression resulted in an appreciation of the standard of living of employed workers, which more than offset the decline caused by wage cuts and dulled the edge of their discontent. After the year 1926, the working class found itself engaged chiefly in defensive struggles.

The period between the World Wars I and II was not productive of far-reaching reforms. The two Labour Party governments of 1924 and 1929-1931, weak regimes of brief duration, were barren of important benefits. The labor legislation of the interwar years either extended the provisions of existing statutes or was restrictive of labor. Provision for voluntary arbitration of labor disputes by a permanent industrial court was contained in the Industrial Courts Act of 1919. In the same year, the government instituted the Whitley Councils, consisting of representatives of employers and workers, to cooperate in the determination of wage rates, hours of work, and other matters. The Insurance Act of 1920 extended unemployment insurance to virtually the entire wage-earning population. Another enactment in 1920 raised to 14 years the minimum age of workers in manufacturing industries. To the mine strike of 1920 and the threat of other unions to strike in sympathy with the

miners, the government replied with the Emergency Powers Act of the same year. By that law, the government was empowered, when industrial disturbances threatened the supply of the necessities of life, to declare a state of emergency and issue regulations to insure the supply of food, water, fuel, light, and transportation. Following the general strike of 1926, Parliament enacted the Trade Union and Trade Disputes Act of 1927, which proscribed general strikes and most sympathy strikes, restricted picketing and the political activities of unions, and prohibited the affiliation of organizations of state employees with the Trades Union Congress, the national federation of unions.

All laws governing labor relations in manufacturing industries were codified and, in many instances, strengthened by the Factories Act of 1937. The maximum work week for women and young persons was reduced to 48 hours, and of children between 14 and 16 years of age, to 44. Other provisions of the act related to standards of factory lighting, fixed rest and meal periods, and night work. Coal mines were partly nationalized in 1938. The Holidays With Pay Act of 1939 empowered trade boards and other statutory wage-fixing bodies to make paid holidays compulsory in industries under their jurisdiction.

During World War II, state regulation was extended virtually to the entire national economy. Strikes and lockouts were prohibited. Compulsory arbitration was instituted. All men and women between 18½ and 51 years of age were made liable to service at the government's discretion in the military or civilian-defense establishments, industry, or various public institutions. A minimum work week of 52 hours was established for industrial workers.

A number of minor reforms were instituted. Minimum wages and paid annual holidays were established in various occupations. The Wages Council Act of 1944 provided for wage-fixing machinery for occupations in which wages were adjudged unfair and the means for effective collective bargaining did not exist. But throughout the war the government resisted the demands of the unions and the Labour Party for sweeping social reforms.

When the Labour Party came to power in 1945, it was under the compelling necessity of implementing without delay the program of economic and social reforms on which it had based its appeal for support. It was also under the desperate necessity of increasing exports and holding down imports, which it exerted itself to do by increasing production and curbing consumption at home. Impelled to introduce far-reaching reforms, it was simultaneously compelled to initiate policies which limited the efficacy of the reforms.

The Labour government nationalized the Bank of England, the coal mines, electric utilities, overseas communications, railways, road transport, canals, docks, and harbors. It established public corporations to take over civil aviation, made cotton buying a government monopoly, and invested towns and rural communities with exclusive control of land development.

Prior to nationalization, the state entered the sphere of labor relations as an arbiter or regulator and only to the extent provided in parliamentary statutes. Nationalization made the state the employer of millions of workers. In the sense that the state, in common with other em-

ployers, was constrained to negotiate collective agreements with its employees and was limited by statute in the terms it could negotiate, the characteristic capitalist contractual basis of labor relations was retained, and no fundamental change was effected by nationalization in the scope of labor legislation. On the other hand, the state, as the employer in the nationalized industries, performed innumerable actions and made a multitude of decisions in all phases of the sphere of labor relations, which, in their sum, comprised a continuing process of administrative enactment. Thereby labor legislation was partially transformed from a limited means of regulating employer-employee relationships to an inclusive *modus vivendi* in industry between the state and the working class.

Other important developments in labor legislation followed the inauguration of the Labour government. Repeal in 1946 of the Trade Disputes Act of 1927 restored the freedom of action of trade unions. Later, during the drive for increased production, the Labour government had recourse to coercive measures. For example, the Control of Engagement Order of 1947, which lapsed in 1950, was intended to reduce labor turnover in industry by limiting the freedom of workers in transferring from one job to another.

The most important measures of the postwar Labour government were four acts which implemented the program of social security for all "from the cradle to the grave," projected during the war by Sir William Beveridge (q.v.). These measures were the National Insurance, National Health Service, National Assistance, and Industrial Injuries acts.⁴

Other Labor Legislation.—In its essential features, the labor legislation of most other countries is identical with that of the United Kingdom. Divergences are the result primarily of differences in the time, tempo, and degree of industrialization in various countries; in the effect of industrialization on peoples of diverse histories, cultures, and socio-economic structures; and in the course of social development and the strength of the labor movement in different nations.

German Labor Legislation.—Before World War I, German labor legislation, which originated in 1839 in a Prussian law restricting child labor, was essentially paternalistic in motive when it was not repressive. An industrial code regulating the employment of women and children was adopted in 1869. In the 1880's, the Social Democratic movement was outlawed; working-class economic organizations were restricted, and in accordance with prevailing theories of state socialism intended to win the workers from allegiance to the socialist movement, pioneer enactments in sickness, accident, invalidity, and old-age insurance were adopted. Later measures legalized trade unions and working-class political parties.

Important developments in German labor legislation took place after the revolution of

⁴ The Insurance Act provided comprehensive insurance for unemployment and sickness; maternity benefits and payments to widows and orphans; old-age pensions; and death benefits. Relief for those not covered by the Insurance Act was provided in the Assistance Act. By the terms of the Health Service Act, complete medical and dental care, including the services of specialists and hospitals, became available without charge. The Industrial Injuries Act transferred workmen's compensation from private companies to the state.

1918, which overthrew the monarchy and created the Weimar Republic or Second Reich. The constitution of 1919 established the role of labor legislation as a means of achieving elementary social justice and defined its function as a component part of a coordinated program for the government regulation of industry.⁵

A series of enactments during the 1920's made collective agreements the legal basis for the regulation of labor relations, established industrial courts with power to enforce compulsory arbitration of labor disputes, and enlarged the scope of social insurance. The Nazi dictatorship of Adolf Hitler (q.v.) aborted the postwar development of German labor legislation. (See also *Totalitarian Labor Legislation* below.)

Other European Countries.—In general, the labor laws of France, the Low Countries, and the Scandinavian countries followed the basic pattern of British labor legislation. In central and eastern Europe before World War II, the scope of labor legislation varied greatly. It was more developed in industrialized countries, less extensive in countries with predominantly agrarian economies. Austrian legislation was influenced by the development of German enactments. Czechoslovakian labor legislation included broad measures of social insurance. Hungarian labor laws were essentially protective measures.

Australasia.—The Australasian states were among the first countries to adopt laws relating to general categories of workers. They pioneered in the enactment in the 1890's of the first general eight-hour laws, minimum-wage statutes, and measures providing for compulsory arbitration of labor disputes by special permanent courts. The further course of Australasian labor legislation consisted essentially of the elaboration of these early laws and the inception of old-age and widows' pensions; unemployment, sickness, and maternity benefits; medical, hospital, and dental services; and other social services.

Canada and Latin America.—In the New World, Canadian labor legislation, enacted almost entirely in the 20th century, was strongly influenced by the course of labor legislation in the United States. The formulation of Latin American labor legislation followed the large-scale exploitation of natural resources by United States, British, and other capitalist interests, which occurred in Central and South America after World War I. In essence, the labor legislation of Latin American countries was conceived as a weapon of defense against oppressive foreign penetration; and the more advanced legislation, the greater was its effectiveness as the cause of nationalism. Hence, it was taken whole in most instances from the advanced social legislation of other countries; it was also markedly influenced by the conventions of the International Labor Organization (q.v.). Restricted first to industrial workers, who comprised a relatively small minority of the laboring popula-

tion in the predominantly agrarian and semi-industrialized countries of Central and South America, this legislation subsequently became more inclusive of other categories of workers. It reached its greatest development in Mexico. In some countries, notably Brazil and Argentina, it became restrictive of labor.

Totalitarian Labor Legislation.—Under totalitarian dictatorships, labor legislation is transformed from a component part of social reform into an instrument of authoritarian state regulation of life. Fascist states effect the transformation on the basis of private property; states on the order of the Soviet Union, on the basis of the collective ownership of the means of production and exchange. The statutory protection of workers under totalitarian governments may exceed in scope the labor legislation of other states. But such protection is only nominal, or is used as a temporary expedient to win working-class support, or is extended only to favored categories of workers; and it has less significance than companion laws and practices which tend, or are intended, to reduce labor to the status of slavery.

The principles of fascist labor law were elaborated first in Italy after political liberty had been abolished and the trade unions had been crushed. The main embodiments were a law enacted in 1926 and the Labor Charter of 1927 which established labor's role in the corporative state.

Nazi Labor Policy.—Fascist labor policy underwent its fullest development in Germany under the Third Reich, which, in creating a state with unlimited powers, almost entirely obliterated the distinction between public and private law. Under the Nazi dictatorship, private property was retained as the basic form of property relations, but the state determined its use. Contractual relationships were retained in form; in substance, they were replaced by state dictation. All phases of production, distribution, and consumption were regulated by the state. Political and civil liberty were abolished. Trade unions were suppressed and were replaced by the Nazi Party-controlled Labor Front, in which membership for all German workers and employers was compulsory. The basic principles of Nazi labor policy, laid down in 1934, applied the leadership principle to business; each enterprise constituted a shop community in which the owner was the leader and the workers his followers. Employers were made responsible for the determination of labor conditions and acquired the right to levy money fines on their "followers." State officials, called labor trustees, enforced loyalty to the shop community with the help of the secret police. Labor courts decided controversies affecting individual workers. Social-honor courts punished violations of the principles governing the conduct of business.

The driving force in Nazi labor policy was an acute labor shortage, arising before 1939 from the extensive preparations for war, and then from the war itself. All means were used to augment the labor force and increase production. Child labor increased. The employment of women was extended. Factory inspection was virtually eliminated. Social-insurance benefits were curtailed, and the huge funds which accumulated were invested in government bonds and thus used to finance the preparations and conduct of the war. The intensity of work was increased by the extensive reintroduction of piecework and by

⁵ The constitution affirmed the right of private property and freedom of contract, but circumscribed them "to the extent that all may be guaranteed a decent standard of living." To protect their interests, workers were guaranteed freedom of association. At the same time, the constitution declared labor to be "under the special protection of the Reich," and provided for the adoption of "a unitary labor code." Implementation of the constitutional provisions giving labor equal representation with employers "in the regulation of salaries and working conditions, as well as in the entire field of the economic development of the forces of production," was frustrated by the position of the employers.

freezing wages at the lowest levels prevailing in the economic depression of the 1930's. Long hours of work prevailed. Under a law promulgated in 1938, all German men, women, and children were subject to conscription for work or training at the direction of the state. After the outbreak of war, workers were frozen in their jobs. Thus, German labor was reduced to a status of industrial serfdom.

Soviet Labor Laws and Decrees.—From its inception, Soviet labor legislation formed an integral part of the policy of the state. The first labor decrees enacted after the Bolshevik Revolution of November 1917 were shaped by the purpose of the founders of the Soviet state to construct a dictatorship of the proletariat. The decrees were intended to establish active participation by the workers in the management of the national economy, to increase productivity on the basis of the willing collaboration of the workers in the construction of the new social order, and to institute the most advanced measures with respect to working conditions. A series of decrees provided for workers control of production, through trade unions and factory committees, in industry, trade, banking, agriculture, and transport; labor exchanges organized by the unions under the control of the local soviets; the eight-hour day; limitations on overtime, night work, and child labor; annual paid vacations; a broad and comprehensive system of social insurance; and rules governing the negotiation of collective agreements, the establishment of wage rates, and other matters. The underlying principles of this legislation were embodied in the Soviet constitution.

The intentions of this early legislation were not realized, as events imposed on Soviet society an unforeseen course of development. Workers control of production, instituted before industry was nationalized, led many employers to abandon, and others to sabotage, their enterprises. Still others were expelled by the factory committees which proclaimed their ownership of the enterprises they were created to control. For these and other reasons, the economic disruption caused by the war and the revolution was intensified and productivity declined.

Civil war, foreign intervention, and war with Poland supervened, virtually ruined the national economy, and threatened the Soviet regime with extinction. In the struggle for survival which began in the middle of 1918, known as the period of war communism, the dictatorship of the proletariat was equated with the dictatorship of the Bolshevik Party; the one-party state came into being. The first Soviet labor code, promulgated in 1918, contained many provisions designed to improve the situation of the workers, but these were unenforceable in the circumstances, and had less practical significance than the provisions of the code obliging unemployed workers to accept any work offered them, empowering the government to transfer unemployed workers to places where they were needed, establishing obligatory standards of productivity, and providing for remuneration for work in kind as well as in money. Industrial conscription for all workers was instituted in January 1920, and was followed by the creation of labor armies under state control. In effect, labor was militarized and nationalized.

During the period of war communism the central problem was survival. In the period which

followed, the principal task was economic recovery. In order to increase production, the Soviet regime in 1921 introduced the New Economic Policy. Under the N.E.P., capitalist forms of economic activity were encouraged, but the "commanding heights" of economy were retained by the state. The labor armies were disbanded but social incentives to work received little emphasis; personal interest was stressed. Piece work was introduced. Workers control of production was eliminated; the authority of managerial personnel was affirmed. A new labor code, adopted in 1922, emphasized social insurance and other benefits. The trade unions were charged with strict supervision of the protective and social-insurance provisions of the labor code. They also were made responsible for the maintenance of labor discipline; and were required to aid in increasing productivity and to participate in the state bodies which determined economic policy. The dualism in the role of the union was resolved in time, in favor of their function as organs of the state.

An important development under the N.E.P. was the inception of compulsory labor and its inclusion within the purview of criminal law. The *Correctional Labor Code* of 1924 and its subsequent amendments provided for "compulsory labor without detention under guard" of persons "sentenced . . . by the verdict of a court, or by an administrative organ."⁶

The N.E.P. rescued the national economy from chaos but left unsolved other pressing problems. Unemployment persisted as industry languished; the peasants, unable to buy industrial products, had no incentive to market agricultural produce, withheld food from the cities, and became hostile to the regime. A social crisis impended. In 1928, in order to increase industrial and agricultural production, the government instituted national economic planning in the form of the First Five-Year Plan. Other plans followed in later years. New industries were created, unemployment was eliminated, and an acute labor shortage developed. Millions of peasants were transformed into proletarians. Owing to the inexperience of the new labor force, the lack of trained technical, managerial, and administrative personnel, and other causes, the productivity of Soviet industry was relatively low and the cost of production high.

In the solution of all problems, the Soviet state, which under Joseph Stalin (q.v.) had become an authoritarian dictatorship, relied primarily on coercive measures. In increasing degree the distinction between civil law and criminal law was obliterated. Economic relationships which in other countries stand outside the reach of the law, or fall within the jurisdiction of civil law, were brought within the purview of criminal law and were directly related to the security of the state. The regulation of labor relations became to a large extent a part of

⁶ Such persons could be made to work at their habitual places of employment or at "correctional labor camps and other institutions, either near their homes or in distant regions. Persons sentenced to compulsory labor at their habitual places of work received 50 per cent of the wages; the remainder was retained by the government agencies charged with execution of the compulsory-labor program. Other persons sentenced to compulsory labor worked, "as a general rule, without remuneration." Compulsory laborers were given a food allowance which could be "augmented according to the amount of energy expended by them." Other provisions related to disciplinary measures and the privileges of compulsory laborers.

criminal law. A series of decrees during the 1930's, which totally subordinated labor to the state, incorporated the unions into the state; provided for the industrial mobilization of children, housewives, and widows; directed the mass recruitment of peasants for industrial work; ordered the direction of workers from less essential to more essential industries; increased the intensity of work by speedup, extension of piecework, and sharp differentiation in wages; gave the directors of enterprises authority to establish production quotas, fix wage rates within the limits of the state bulk appropriations for wages, control the assignment of housing accommodations and, for a time, the food supplies of workers; levied taxes on wages; circumscribed social-insurance benefits; established fines for violations of labor discipline; introduced the work book, in which each worker was required to carry; prohibited workers from transferring to other jobs without permission; and revived the czarist decree of passports for travel within the country. Under decrees related to awards for high production records, the protection of workers against abuses, and the regulation of privileges extended to workers. Violation of the regulations and protests against working conditions led to arrest by the secret police. Strikes were suppressed by armed force.

During the forced collectivization of agriculture in the 1930's, millions of peasants were appropriated and deported to Siberia and other regions, where they became compulsory laborers. Compulsory labor was placed under the jurisdiction of the secret police. The *Corrective Labor Order* of 1933-1934, which codified existing legislation regulating compulsory labor, contained provision for medical, cultural, and educational services and various privileges for compulsory laborers, but in practice these were largely ignored, and compulsory laborers were treated as industrial slaves. Before World War II, slave labor became a critical factor in achieving low production costs and an integral feature of Soviet society. The operation of entire industries and development of vast areas on the basis of slave labor occupied a prominent place in Soviet planning; and the regulation of slave labor constituted an important part of Soviet labor legislation.

During the war, further restrictions on labor were decreed. The work day and work week were extended. Persistent absenteeism in a number of essential industries was made punishable as desertion. Enrollment of young persons in vocational schools was made compulsory; and for years following completion of their studies, they were subject to assignment by the state to work in the industries for which they were qualified. The number of slave laborers was augmented by the forcible deportation to Siberia of other regions of millions of Volga Germans, Poles, Crimean Tatars, and other peoples regarded as antagonistic or potentially hostile to the regime. Prisoners of war were also used as slave laborers.

After the war the extreme rigor of Soviet labor legislation was partially attenuated, but wartime measures were retained as the government intensified its efforts to build industry and armaments and construct a vast power program in Europe and Asia. The institution of slave labor continued to flourish. And Soviet

labor policies and legislation, including slave labor, became the model for labor laws in Rumania, Poland, Yugoslavia, Bulgaria, Czechoslovakia, Hungary, the German Democratic Republic, China, and other Asiatic countries.

International Labor Legislation.—In the literal sense of a body of laws embracing established legal principles relating to the regulation of labor relations, enacted and enforced by an international authority, international labor legislation does not exist. Whether a uniform code of labor laws which will be applicable to all countries can be formulated or is desirable are debatable questions.

It is customary, however, to designate as international labor legislation the conventions of the International Labor Organization, which have exercised a considerable influence on the labor legislation of various countries. These conventions relate to the hours and conditions of work, minimum wages, child labor, the right to organize, the protection of workers in foreign countries, and other aspects of labor relations. To the extent that these conventions are adopted by various governments, they constitute treaties which tend to establish uniform minimums in labor conditions on an international scale, and bring labor relationships within the purview of international law.

Additional information on the labor legislation of various nations will be found in the articles on those countries. Bibliography.—Texts of statutory labor laws and regulations enacted in different countries from 1906 to 1919 can be found in the *Bulletin of the International Labor Office*, and from 1919 in the *Legislative Series* of the ILO. Texts of German National Socialist decrees were published in the *German Bulletin of Laws (Reichsgesetzblatt)*; of Soviet decrees, in *Collection of Decrees and Regulations of the Workers and Peasants Government of the Soviet Socialist Republics, 1921-1938*, *Collection of Laws of the Government of the USSR, 1939-1940*, and subsequent collections. Additional official data will be found in the *Studies and Reports* of the ILO and the *Bulletin and Monthly Labor Review* of the United States Bureau of Labor Statistics. An inclusive compilation of texts of constitutional provisions relating to labor relations is contained in *Constitutional Provisions Concerning Social and Economic Policy* (1944) published by the ILO. Texts of ILO conventions are contained in the ILO publication, *International Labor Conventions and Recommendations* (1949). Analytical material will be found in works by Cole, George D. H., and Postgate, Raymond, *The British Common People 1746-1946* (New York 1947); Tannenbaum, Frank, *Whither Latin America?* (New York 1934); *Fascism in Action*, House Document No. 401, 80th Congress, First Session (Washington 1947); U.S. Department of State, *National Socialism* (Washington 1943); Kuczynski, Jurgen, *A Short History of Labour Conditions in Germany Under Fascism* (London 1944); Baykov, Alexander, *The Development of the Soviet Economic System* (New York 1947); Dallin, David J., and Nicolaevsky, Boris I., *Forced Labor in Soviet Russia* (New Haven 1947); Smith, Walter Bedell, *My Three Years in Moscow* (Philadelphia 1950); Solano, E. John, ed., *Labor As An International Problem* (London 1920).

THOMAS STAMM.

LABOR ORGANIZATION, International.
See **INTERNATIONAL LABOUR ORGANIZATION (ILO)**.

LABOR or LABOUR PARTY, The, a British political party, resulting from a federation of trade union and Socialist bodies which took place at London Feb. 27, 1900, and which

was originally known as the Labor Representation Committee. The name "Labor Party" (the British spelling is "Labour") was adopted in 1906. The London conference declared the purpose of the party to be "to establish a distinct Labor Group in Parliament, who shall have their own whips and agree upon their own policy which must embrace a readiness to co-operate with any party which for the time being may be engaged in promoting legislation in the direct interest of labor." The party is an outgrowth of Fabianism (see **FABIAN SOCIETY**), and of various other efforts to promote the interests of labor through political movements. In 1906 the party placed 50 candidates in the field and 29 were elected. By 1910 it had increased its membership in the House of Commons to 42. The outbreak of World War I brought its troubles. J. Ramsay MacDonald, who had been chairman of the party since 1906, resigned his leadership because of his pacifist leanings, and Arthur Henderson carried on, supporting the government's war program loyally, though himself an advocate of peace. In 1922, however, MacDonald was again returned to Parliament, and soon again became head of the Labor Party, which in 1923 became the second largest in the House of Commons. In 1924 Mr. MacDonald, supported by the Liberals, as well as his own party, was invited to form a cabinet, and thus came into power Britain's first Labor government. MacDonald served as prime minister from Jan. 22, 1924 until Nov. 4, 1924, when his government fell. However, the Labor Party again came into power in 1929, and Mr. MacDonald once more became prime minister. This time he served until Aug. 25, 1931, when, because of dissension in the ranks of his party, his government resigned. He then formed the national coalition government at the head of which he served until he resigned June 7, 1935 because of ill health. However, he was forced to give up his party leadership in 1931, and was succeeded by Mr. Henderson, who gave up the leadership a year later. In 1935 the Labor Party elected 154 members to the House of Commons. In 1942 the affiliated membership of the Labor Party was 2,453,000, as compared with 2,663,000 in 1939. Despite its wartime membership decline, after the defeat of Germany in World War II, the Labor Party won a sweeping victory in the general elections of July 1945. The new Labor Government formed by Prime Minister Clement R. Attlee had a parliamentary majority of 146.

In 1946 at the 45th annual conference the party overwhelmingly confirmed rejection of the Communist Party's plea for affiliation, and endorsed Foreign Secretary Ernest Bevin's foreign policy. Seeking renewal of popular confidence Attlee dissolved Parliament on Oct. 5, 1951; but at the elections 20 days later the Conservatives and associates won a majority of 17 and took over the government. At the general elections of May 26, 1955 the Labor Party showed further decline; a popular vote of 12,405,130, compared with 13,948,605 in 1951, reduced to 277 the Labor seats in the Commons, while the Conservatives and associates increased to 345 seats.

LABOR TERMS. The following terms dealing with labor, labor-management relations, and particularly with wages, were adapted, for the most part, from standard glossaries. While many of the terms have more general use, their labor

connotation is here given. As far as possible terms not in current use have been omitted.

- Absenteeism.**—The failure of workers to report for work for whatever cause. See article **ABSENTEEISM**.
- Accessions.**—New hires and rehires by individual employers, one of the two major trends in labor turnover. Statistically, the total number of permanent and temporary additions to the employment roll, including both new and rehired employees.
- Across-the-Board Increase.**—A general wage increase affecting all or most of the employees of a plant, company, or industry simultaneously. May be either a uniform percentage or cents-per-hour.
- Allowed Time.**—Total time allowed or set as standard to complete a task or element of a task under wage incentive systems. Also, time permitted workers for care of tools, rest periods, or for other purpose. Both are combined in establishing piece rates or production bonuses.
- Annual Wage or Employment Guarantee.**—An arrangement under which an employer guarantees some amount of his workers a minimum amount of wages or employment during a year.
- Apprentice Rate.**—Schedule of wage rates for workers being given formal apprenticeship training for a skilled job. Usually established in a series of steps leading to the journeyman rate at the end of the term of apprenticeship.
- Apprenticeship.**—Formal on-the-job and classroom training program under joint employer and union auspices and under public supervision whereby "indentured" young workers learn a skilled trade during a stated period of time and for which they receive wages according to a set apprentice rate.
- Arbitration.**—See **ARBITRATION, INDUSTRIAL**.
- Assessment.**—A charge levied by a union on each member for a purpose not covered by regular union dues, may be either one time or periodic charges.
- Automatic Progression.**—Policy whereby wage rates of workers on jobs with established rate ranges are increased automatically and at set time intervals. All refers to automatic periodic wage advances for trainees and apprentices.
- Average Straight-Time Hourly Earnings.**—Average wages earned per hour excluding premium overtime payments and shift differentials.
- Back Pay.**—Wages which must be paid to an employee who has been discharged, either in violation of law or against the terms of a contract. Delayed payment of part of the wages for a particular period of time, arising from arbitration awards, grievance procedure regarding particular rates, errors in computation of pay, or interpretation of wage legislation. See **RETROACTIVE PAY**.
- Back-to-Work Movement.**—An organized effort to open a struck plant, participated in by employees opposed to the strike, by certain elements of the community, including at times the police, usually initiated by the management of the plant.
- Base Rate.**—The amount of pay for a unit of time worked, exclusive of premium pay for overtime or other premium payments. Under incentive wage systems, other than piece rates, may refer to the rate paid for production at "standard." May refer to the amount guaranteed per hour or other time period.
- Board of Inquiry.**—A body named by the president in national emergency dispute under the Taft-Hart Act to study the situation and make recommendation to the president.
- Bonus.**—Any payment above regular or base wage rate. Includes extra payments for night work, hazardous or extra unpleasant work, regular attendance, an overtime, as well as any annual or regular allotment such as a Christmas bonus.
- Bootleg Wages.**—Wages above prevailing rate or union scale paid in a tight labor market to attract or hold employees or below the prevailing rate or scale when an employer has accepted in order to obtain or hold employment in a slack labor market.
- Boycott.**—Refusal to buy the products of or to deal with a firm as a means of exerting pressure during a labor dispute. See also article **BOYCOTT**.
- Call-in Pay.**—Amount of pay guaranteed to a worker called in to work on a day on which he otherwise would not have reported if there is no work available or if he is not given a full or half shift of employment. This is also called **Reporting Pay**.
- Casual Workers.**—Persons employed irregularly.
- Central Labor Union.**—A city or county federation of local unions having affiliation with different international unions but with the same parent body, the American Federation of Labor (AFL). The Congress of Industrial Organizations (CIO) equivalent is the Industrial Union Council.
- Certification.**—Designation by a labor board (national or state) of a union as entitled to bargain as exclusive representative of employees in a certain unit.

Checkoff.—See article CHECKOFF.

Closed Shop.—Agreement between an employer and a union under which only members of the union may be employed. Prohibited by the Taft-Hartley Act except in cases of agreements which were made previously and are still in effect.

Clothing Allowance.—Allowance granted to those employees who are required to buy special clothing in connection with the performance of their work.

Collective Bargaining.—See article COLLECTIVE BARGAINING.

Company Union.—An organization of the employees of a single employer, usually dominated by the employer. Banned by both the Wagner Act and the Taft-Hartley Act.

Comparable Rate.—A rate paid for work agreed or determined to be comparable within a plant, area, or industry. Such comparisons are used in wage negotiations and wage determinations.

Competitive Wage.—The wage level a company must maintain to compete with other firms in the same labor market for particular types of labor. Also, the wage level required by a company to maintain a competitive price position with other firms in its industry.

Conciliation.—Activities of a third party designed to assist contending parties in a labor dispute to reach a voluntary agreement.

Contract.—An agreement defining wages, hours, conditions of employment, and related matters, usually between a union or group of unions and an employer or group of employers.

Contributory Pension Plan.—A pension plan for the benefit of the employee under which the cost is shared by the employer and the employee. See also article PENSION OR RETIREMENT SYSTEM.

Cooling-off Period.—A period of time during which employees may not strike under the Taft-Hartley Act and other laws, requiring a definite period of notice before a work stoppage may be enforced.

Cost-of-Living Adjustment.—An adjustment of wages or salaries in accordance with changes in the cost of living as measured by an appropriate index of the retail prices of goods and services that enter into the consumption of low- and moderate-income families.

Craft Union.—A union made up of members doing a specific type of work and possessing definite skills required to do that work. In actual fact, there are few pure craft unions in the United States.

Idle Time.—Time lost by a worker because of a lack of materials, a breakdown of machinery, or other causes beyond his control.

Incident Pay.—Special payment to a transportation worker who is required to report for work at a point far removed from his home terminal.

Recertification.—Withdrawal by a labor board of designation of a union as the bargaining representative of a group of employees as a result of a vote by the employees expressing the wish of a majority no longer to be represented by the certified union. The vote, a decertification election, is provided for in the Taft-Hartley Act.

Disability Compensation.—Insurance program (in New Jersey, California, Rhode Island, New York, and in railway employment, 1953) to provide for costs of medical care and loss of wages resulting from inability to work resulting from non-work connected injury or sickness.

Discharge.—Permanent separation of an employee from an employer's payroll, initiated by the employer for such reasons as incompetence, violation of rules, dishonesty, insubordination, laziness, habitual absenteeism, or inability to meet physical standards.

Discrimination.—Refusal to hire, promote, or admit to union membership because of race, creed, color, sex, or national origin; also, refusal to hire or promote or hiring or promoting as a means of assisting or weakening a union.

Discriminatory Discharge.—Discharge for union activity or because of union membership, an unfair labor practice under both the Wagner Act and the Taft-Hartley Act.

Dismissal Pay or Compensation.—A specific payment which is given an employee upon permanent termination of employment through no fault of his own.

Downgrading.—Reassignment of workers to tasks with lower skill requirements and lower rates of pay.

Dual Union.—A labor union attempting to recruit members from among a group of workers already within the established jurisdiction of a union.

Economic Strike.—A strike caused by an issue other than an unfair labor practice of an employer.

Emergency Board.—A board appointed under provisions of the Railway Labor Act by the President when a work stoppage is impending on railways or airlines in interstate commerce.

Emergency Dispute.—A labor dispute in which a work

stoppage would jeopardize the national health and safety, for which the Taft-Hartley Act provides special procedures, including establishment of a Board of Inquiry, issuance of an 80-day injunction, and voting by employees on the employer's last offer.

Employee Representation System.—A plan under which representatives of the employees of a company are elected to a joint worker-management council at which grievances or company policies are discussed.

Employer Association.—An organization of employers in the same industry or line of business or locality, formed for common action in labor matters; occasionally these act as bargaining agent with a union or group of unions.

Entrance Rate.—The hourly wage rate which a worker receives upon being hired into an establishment.

Equal Pay for Equal Work.—Payment of equal compensation to all employees within an establishment or other unit performing the same kind and amount of work, regardless of race, sex, or other characteristics of the individual workers.

Escalator Clause.—Provision in a union agreement allowing for adjustment of wage rates in accordance with changes in the cost of living as measured by an appropriate index.

Escape Period.—A period of time during which workers may resign from a union in order not to be bound to continue membership obligations upon renewal of a union shop, checkoff, or maintenance-of-membership provision.

Exclusive Jurisdiction.—A basic principle of unionism in the United States, that a national or international union will not be challenged in its right to organize and represent all workers doing certain stated types of work as specified in the charter of the organization.

Fact-Finding Board.—A board appointed to determine the facts and make recommendations for a settlement of a major labor-management dispute.

Fair-Employment Practices.—Employment practices, including firing and promotion, which do not violate prohibitions against discrimination based on race, color, religion, or national origin.

Featherbedding.—Requiring that workers be hired to perform services which are not needed, prohibited by the Taft-Hartley Act.

Federal Labor Union.—A local union composed of workers engaged in occupations not included in the jurisdiction of a national or international union and chartered directly by the AFL. The CIO equivalent is the Local Industrial Union.

Fixed Shift.—When a group of workers maintains the same schedule of hours of work week after week.

Free Riders.—A term applied by union members to non-members who enjoy without costs the benefits of a contract obtained through the efforts of the dues-paying members.

Free Speech.—Guaranteed to employers by the Taft-Hartley Act; they can express their hostility to unionization but may make no threat of coercion or promise of benefit. Coercive expressions are unlawful interference with workers' rights. Also, the legal basis of picketing.

Fringe Benefit.—A benefit supplemental to wages received by workers, including paid holidays, paid vacations, pensions, health, welfare, and insurance benefits.

Furlough.—A layoff period.

General Strike.—Wide extension of sympathetic strikes throughout virtually all enterprises of an area in support of primary strike.

Grievance.—Complaint of an employee, a union, or an employer, that a provision of a collective bargaining agreement has been violated.

Grievance Committee.—A body designated by a union to meet regularly or on call with the management to seek adjustment of accumulated grievances.

Guaranteed Rate.—Rate of pay guaranteed to an incentive worker.

Guaranteed Wage Plan.—See ANNUAL WAGE OR EMPLOYMENT GUARANTEE.

Handicapped Worker Rate.—A lower rate of pay for a worker whose efficiency is impaired because of physical or mental handicaps.

Hiring Hall.—A place where workers gather for assignment to employment. Most common in maritime and waterfront employment arrangements, but also found in other lines of work, such as the building trades. Operated on the principle that the man who has waited longest has first chance at the next assignment.

Holiday Pay.—Payment to workers, usually at regular rates, for holidays not worked. For work done on holidays, payments are often provided at premium rates.

Homework.—Work done in the homes of workers, usually on a piecework basis, formerly common in the garment industry, where it was also known as the sweatshop system.

Hot Goods or Cargo.—Produced by strike-breakers or

- workers hostile to a union, which union members resent having to handle or use.
- Hourly Rate.**—The rate of pay expressed in cents-per-hour applying to workers paid on a time basis.
- Impartial Chairman.**—A "third party" designated under an agreement between a union and an employer or employers' association to arbitrate grievances arising under the contract. Used extensively in the garment industry for setting "prices" on individual operations.
- Improvement Factor.**—An annual wage increase of a stipulated amount during the life of an agreement, first adopted by the CIO Auto Workers and General Motors Corp. in May 1948, designed to enable the wage earners to share in the benefits resulting from the increased productivity of the entire economy.
- Incentive Rates.**—Wage rate system based on output rather than time worked. May apply to piece rates, rates of pay per unit for production above a predetermined minimum standard of output, a ratio of management-labor sharing of savings in labor costs resulting from operation of an incentive system, or to other methods of pay based on individual or group production performance.
- Individual Rate.**—Where no formal wage structure exists, the wages paid are individual rates, and are based, loosely, on the job being done, the training, ability, skill, and bargaining strength of the individual worker.
- Industrial Union.** A labor organization including all employees of a plant or industry, no matter what type of work they may do; usually includes all production and maintenance workers in the unit, regardless of their skill or training, race or sex.
- Initiation Fees.**—Charges made by a union for the privilege of membership. The Taft-Hartley Act prohibits excessive or discriminatory initiation fees.
- Injunction.** A court order demanding that certain things be done or not be done on the legal ground that otherwise the complaining party would suffer irreparable damages. The issuance of injunctions by federal courts was restricted by the Norris-LaGuardia Act. Violation of an injunction may be punished as contempt of the court issuing the order.
- International Confederation of Free Trade Unions (ICFTU).**—Association of the national trade union federations of the democratic, non-Communist nations. The American Federation of Labor, the Congress of Industrial Organizations, and the United Mine Workers were among the founding groups. The 3d World Congress of the ICFTU was held in Stockholm, Sweden, in July 1953.
- International Union.**—A national union organization with locals in the United States and some other country, usually Canada.
- Job Bidding.**—Process of posting notices of job vacancies to allow interested employees to apply for such openings.
- Job Classification.**—Arrangement of the jobs in a plant or industry into a series of categories, each of which is based on progressively higher requirements in terms of skill, experience, training, and similar considerations. Job classification is possible after job analysis and job description.
- Job Description.**—A written statement listing the elements of a particular job or occupation.
- Job Evaluation.**—Evaluation or rating of jobs to determine their position in a job hierarchy. May be achieved through assignment of points or use of some other rating method for essential job requirements such as skill, experience, and responsibility. Used widely in establishing wage rate structures and in eliminating wage inequalities. Applied to jobs, not to the individuals holding the jobs.
- Joint Board or Council.** A delegate body composed of representatives of more than one local union of a national or international union in an area formed for collective bargaining purposes.
- Joint Rate Setting.**—Process of establishing rates of pay jointly by representatives of management and labor. Union participation in rate setting is extensive in the apparel industries; in industries where management retains greater prerogatives over rate setting, the unions have recourse to the grievance machinery to secure adjustment of unsatisfactory rates.
- Journeyman Rate.**—The rate of pay for a journeyman or fully qualified worker in a skilled craft or trade who has completed an apprenticeship or equivalent training. Typically, the minimum rate for the trade in a particular area, or the union scale.
- Jurisdiction.**—Exclusive right claimed by a union on the basis of its charter to organize a class of employees without competition from other unions. Term also used regarding the scope of authority of a labor board.
- Jurisdictional Dispute.**—A dispute between two or more unions over the right to represent workers doing certain types of work over which each claims to have exclusive jurisdictional rights.
- Jurisdictional Strike.**—A strike to enforce a jurisdictional claim by a union to represent workers doing certain types of work. Prohibited by the Taft-Hartley Act for work involved in interstate commerce.
- Kickback.**—The return of a portion of wages earned as the result of a secret agreement enforced by the person who has hired an employee as a condition of his employment or continued employment, thereby evading payment of full union scales or legal minimum rates. Prohibited by federal law in 1931 for workers on publicly financed construction projects.
- Labor Grade.**—One of a series of rate steps (single rate or rate ranges) in the wage rate structure of an establishment. Labor grades are an outcome usually of some form of job evaluation, by which occupations of approximately equal "value" or "worth" fall into the same grade.
- Labor-Management Relations Act of 1947.**—The basic federal law regulating labor relations of enterprises engaged in interstate commerce (except transportation). Popularly known as the Taft-Hartley Labor Act. Passed over the president's veto on June 23, 1947. See also **ARBITRATION, INDUSTRIAL.**
- Labor Relations Board.**—May refer either to the national or a state board named to administer a labor relations law.
- Labor Turnover.**—As originally used the term meant the act of a master transferring an apprentice to another master to complete his time; at present, it connotes resignations and dismissals of wage or salary-earners. The employer usually computes turnover on an annual percentage basis; a 50 per cent turnover for a year means that dismissals and replacements are equal to half the normal number of persons on the payroll.
- Layoff.**—Temporary termination of employment initiated by the employer without prejudice to the worker. For statistical purposes, lasting or expected to last more than seven consecutive calendar days without pay.
- Learner.**—A worker who receives informal training through actual performance on the job under supervision.
- Learner Rate.** The rate of pay or schedule of rates applicable to workers inexperienced in the job for which they are employed during their training period.
- Local Union.**—Group of organized workers having a charter from a national or international union. Usually, the local's membership is restricted to employees in a single plant or area.
- Lockout.**—A work stoppage initiated by management as a means of forcing employees to accept the terms offered by an employer.
- Maintenance-of-Membership.**—A form of union security widely adopted during World War II, under which employees who were union members or who joined the union must continue so during the life of the contract as a condition of employment, advanced a compromise formula when a union was demanding a union shop or closed shop and the employer unwilling to concede that much union security.
- Majority Rule.**—A basic principle in American collective bargaining, that a union designated by a majority of the employees in a bargaining unit is the exclusive bargaining representative for all of the employees in the unit.
- Make-up Pay.**—Allowances given by employers to piece-rate workers to make up differences between actual piece-rate earnings and earnings at guaranteed rates or statutory minimum wage rates.
- Mediation.**—Offer by a disinterested third party of offices to the parties in a labor dispute; the entrance of a third party into a labor dispute in an effort to effect a settlement. The mediator makes recommendations and assists the disputant parties in reaching a settlement.
- Mediation Service.**—The Federal Mediation and Conciliation Service (FMCS), re-formed as independent agency by the Taft-Hartley Act, defined duties in all labor disputes affecting interstate commerce (except interstate transportation). Its predecessor, the United States Conciliation Service, was a bureau in the United States Department of Labor.
- Merit Increase.** An increase in the wage rate of individual worker on the basis of performance service. May be administered at discretion of the employer, according to provisions of agreements of automatic increases within a rate range, or as a result of periodic performance reviews.
- Minimum Job Rate.**—The minimum wage rate for experienced workers on a given job.
- Minimum Plant Rate.**—The minimum rate of pay experienced workers in the lowest-paid job in establishment.
- Minimum Wage.** Rates of wages, established legally through collective bargaining, below which workers cannot be employed.

Miscellaneous Separations.—Includes termination of employment because of permanent disability, death, retirement on a company pension, or entrance into the armed forces for service of more than 30 days; used in statistical calculation of labor turnover.

Multiple-Employer Unit.—A bargaining unit made up of the production and maintenance workers employed by more than one employer, usually in the same industry and same general area.

National Labor Relations Act.—Popularly known as the Wagner Act, passed July 5, 1935, and in effect until June 23, 1947, when, with amendments, it was included in the Taft-Hartley Act.

National Labor Relations Board. Established by the Wagner Act and continued, with amended authority and organizational structure, by the Taft-Hartley Act, to enforce the provisions of these laws governing labor-management relations of firms engaged in interstate commerce, except transportation.

National Mediation Board.—Federal agency established by the Railway Labor Act charged with mediating labor disputes on the railways and airlines and with conducting representation elections in this area.

Noncontributory Pension Plan.—A pension plan for the benefit of the employee under which the entire cost is borne by the employer.

Nonproduction Bonus.—A bonus that depends on factors other than the output of an individual worker or of a group of workers.

No-Raiding Agreement.—An agreement between two or more unions (which experience has shown to be competing) that they will not seek to recruit members from among already established and certified locals of other unions which are parties to the agreement.

Norris-LaGuardia Act.—Federal anti-injunction legislation adopted March 23, 1932.

Occupational Rate.—Wage rates (single or ranges) that are designated for particular occupations in an establishment, area, or industry.

Open Shop.—A plant where employees are said to be free to join or not to join a labor union as a condition of their employment; the opposite to the closed shop, where only members of a union may be employed. Unionists charge that union membership or activity is the cause of the discharge of workers from open shops.

Outside Union.—A nationally affiliated union seeking to organize the workers in an unorganized plant or one in which the employees belong to a plant union.

Overtime. Time worked beyond a standard workday or workweek for which premium wage rates are customarily paid; may also refer to the wages paid for overtime work.

Overtime Premium Pay.—Payment of wages at premium rate for time worked beyond the regular hours of employment established by union agreement, employer or industry practice, or by law. Typically, "time and a half" is paid for overtime work.

Pace Setter.—A worker who is better than average on a particular job, and whose production is used by the employer as a standard for measuring the amount of work which can be done by employees in a given period of time.

Package.—A term used to describe a combination of benefits received by workers as a result of collective bargaining.

Pattern Settlement.—A key wage settlement setting the pattern for other wage adjustments within an industry or labor market.

Payment by Result.—Any method of wage payment where the amount of the wage depends upon the amount of output.

Penalty Rate.—An extra rate which is paid for hazardous job, late-shift work, Sunday and holiday work, and for overtime.

Perquisite.—Furnishings by employers of food, lodgings, and other payments in kind to workers in addition to monetary compensation.

Picketing.—Conducted usually by members of a union to give public notice of the fact of a labor dispute and to present the union's side of the argument. Peaceful picketing is legally regarded as an exercise of the right of free speech.

Piece Rate.—The predetermined amount paid to a worker for each unit produced under an incentive wage system. May be based on individual or group output.

Piece Work.—A method of wage payment based on units of output.

Plant Union.—An organization of the workers of a single plant, not affiliated with other workers' organizations.

Portal-to-Portal Pay.—Payments made for time spent on company premises in getting to and from the working place, most notably in mining.

Preferential Shop.—A form of union security in which the employer agrees to give certain preference to union members in hiring, or that a certain per-

centage of the work force will be union members throughout the duration of the agreement.

Premium Rate.—Extra rate paid for overtime, work on late shifts, holiday or Sunday work, or work in particularly dangerous or unpleasant occupations. Also used in connection with extra rates paid to employees having exceptional ability or skill.

Prevailing Rate.—Typically the predominant or more common wage rate paid to a group of workers, usually with reference to specific occupations in an industry or labor market area. In making legal determinations, due to a variety of interpretations of the term, it is necessary to have a specific mention of the area, occupation, industry rate, and type of quantitative measure involved to have definite meaning.

Probationary Rate.—Rate of pay for an experienced and otherwise qualified worker during the initial period of his employment on a new job or in a new plant. May be lower than the minimum for the job or may be the minimum rate.

Production Bonus.—A bonus payment directly related to the output of an individual worker or a group of workers.

Quit.—Termination of employment initiated by employee for such reasons as acceptance of another job with another employer, dissatisfaction, return to school, marriage, maternity, ill health, or voluntary retirement where no pension is available.

Racketeer. A union official who extorts money from employers through threatening to cause a strike or to organize a group of unorganized workers.

Rate Cutting.—Reduction by employers of established incentive or time rates in the absence of changes affecting job content.

Rate Range.—A range of wage rates for the same job, with specific rates for individual workers within the range determined by merit, length of service, or a combination of various concepts of merit and length of service. Automatic progression from the minimum to the maximum after specified periods of service is common.

Rate Setting.—The process of establishing wage rates through joint union-management action or by management alone. May involve job evaluation and time and motion study. May also involve comparison with rates for similar work in the industry or in the local labor market.

Real Wages.—The goods and services that can be purchased with money wages; an expression of the purchasing power of money wages. Over periods of time, changes in real wages are obtained by dividing indexes of money wages by an appropriate index of consumer prices.

Recognition.—Acceptance by an employer of a union as the bargaining representative for a group of workers in his employ.

Registration.—Filing of certain required information prescribed by the Taft-Hartley Act by a union with the United States Department of Labor. Failure to so file disqualifies a union from receiving National Labor Relations Board services.

Regular Rate.—The rate of pay received by a worker for all hours of work performed at straight-time rates.

Representation Election.—Voting by employees for the purpose of selecting a bargaining representative, usually conducted by a labor board.

Retroactive Pay. A wage increase effective to an agreed-upon date prior to the date of the agreement. Delayed payment of part of the wages for a particular period, resulting from a retroactive application of wage increases arising from wage negotiations. In a unique award in the textile industry in 1953, an arbitrator ruled that a retroactive wage reduction was in order. See BACK PAY.

Right-to-Work Law.—Legislation passed by a number of states making union security agreements illegal by forbidding contracts which make employment conditional upon membership or non-membership in a union.

Rotating Shift.—System of rotating the crews where two or more shifts are worked in an establishment, to distribute day and night work on an equal basis among the various workers.

Round of Wage Increases.—A term widely used since World War II to describe broad wage movements affecting large segments of the economy. Actually these wage movements exhibited great internal diversity and were in no sense uniform, except that they came at about the same period of time.

Royalty.—Payments to the union health and welfare funds of the mine workers' and of the musicians' union, based on the number of tons of coal mined or phonograph records produced. Also, a basis for payment of composers, singers, and authors, as a percentage of the sales of sheet music, records, and books.

Runaway Rate.—A piece rate or incentive rate, which,

- because of changed technology or faulty rate setting, results in earnings which are out of line with earnings of workers doing jobs with similar requirements in the same area or industry.
- Runaway Shop.**—A business removed from where it has been operating in order to avoid bargaining with a union.
- Run-off Election.**—A second employee representation election conducted by a labor board between two alternative choices after a first election has failed to show a majority preference among three or more alternatives.
- Salary Rate.**—For workers hired on a weekly, monthly, or annual basis, the rate of pay is normally expressed in terms of dollars per week, month, or year, although they may be paid monthly, semi-monthly, or more often.
- Scab.**—Term of opprobrium applied by strikers to non-striking fellow employees.
- Secondary Boycott.**—Refusal to deal with or buy goods or services from a firm which is a customer or supplier of an employer with whom the union has a dispute, thereby attempting to bring economic pressure to bear on the employer involved in the primary dispute.
- Secondary Strike.**—A strike against an employer in which a union attempts to force that employer to use pressure upon another employer who is being struck by the union, to induce the other employer to accede to the union's demands.
- Selective Placement.**—Employment placement process devised to match productive capabilities of handicapped workers with requirements of jobs to achieve the fullest possible utilization of their potential skills.
- Seniority.**—Length of service of an employee with an employer (or in a department or other subdivision), serving as the basis of rights accorded, as in the order of layoff and of rehiring, or in preference for promotions if other factors are equal.
- Separations.**—Terminations of employment initiated either by the employer or the employee, one of the two major trends in labor turnover. Includes quits, discharges, layoffs, and miscellaneous separations (including military).
- Severance Pay.**—A cash allowance made to a worker leaving a payroll, who has not qualified for a pension.
- Share-the-Work.**—Limiting the number of hours worked by each employee instead of laying off employees during periods of slackened business.
- Shift.**—A term applied to a work period when two or more groups of workers are employed at different hours during the operating time of an establishment. In some industries, the terms "tricks" or "tours" are used instead of "shifts."
- Shop Steward.**—Union official named by a department or other small number of employees to represent them in grievance cases with the foreman or supervisor.
- Shutdown.**—Temporary closing of a shop or plant due to slackened business or changing equipment for the production of new models or of new products.
- Single Rate.**—A rate of pay which is the same for all workers on the same job or in the same job classification, and under which the individual worker on a job receives the same rate during the entire time that he is holding the job.
- Sit-Down Strike.**—Work stoppage in which the strikers stayed inside the plant but refused to work. Used in a number of dramatic situations, 1935-1937, but declared illegal in the *Fan Steel* decision; reported to have been used by some East German workers in mid-1953.
- Slow-Down.**—Concerted restriction of speed of work to enforce demands made upon an employer. In transportation, this may take the form of a "Rule Book Strike" in which all the rules "in the book" are observed literally, thereby slowing train schedules.
- Special Permit Rate.**—A wage rate paid to a union worker who comes from another city and is employed under a special permit because of local labor shortages, and usually the same rate as paid to a permanent worker; in the brewery industry, however, during the peak summer season, this rate is usually lower than that paid to "regular" union brewery workers.
- Speed-up.**—Increasing the pace of operations, usually through accelerating the speed of machines which employees must attend; usually this is done without the consent of the workers.
- Spendable Earnings.**—The money earnings of workers less various amounts deducted for taxes and other purposes from the payroll; broadly equated to "take-home pay."
- Split Shift.**—Daily working time that is not continuous, but distinctively split into two or more working periods. This is typical in local transportation (peak or rush periods) and in food dispensing.
- Standard Rate.**—A basic rate of pay established for an occupation in a plant, industry, or community through collective bargaining, company regulation, or by law.
- Stretch-out.**—Increasing the work quota of employee through assigning a larger number of operations to be performed or a larger number of machines to be attended by each employee.
- Strike.**—Concerted stoppage of work by a group of employees used as a means of exerting economic pressure on their employer in order to win recognition or acceptance of terms advanced by the employees. Statistically, a stoppage must be for one shift or more or one day or more to be counted as a strike.
- Strikebreaker.**—A person engaged in the "trade" of taking employment in struck plants, either as "production worker" or as a guard. This activity was sharply curbed by the passage of a federal law prohibiting the transportation of strikebreakers in interstate commerce and by tightening state laws for licensing agencies which furnished strikebreakers.
- Subminimum Rate.**—A wage rate below the minimum established for an occupation, establishment, industry, or area by union agreement, law, or policy, paid to learners, substandard, superannuated, probationary, or special permit workers.
- Submission.**—A statement of the issues of a dispute agreed upon by the parties which furnishes the basis of an arbitration.
- Subsistence Allowance.**—A payment to a worker for expenses covering meals, lodging, and transportation while in a travel status for his employer.
- Substandard Rate.**—A rate of pay below the prevailing or standard level for a worker whose efficiency is impaired because of physical or mental handicaps.
- Super Seniority.**—Granted in certain contracts to union shop stewards, in order that the employees will have union representation for grievances so long as they are any workers in their department.
- Superannuated Rate.**—A rate of pay below the prevailing level for a worker above a certain age. Frequently such rates are allowed in union agreements, some of which set a definite proportion of superannuated workers who are to be employed under the terms of the contract.
- Supervisor.**—An employee who has the right to hire and fire other employees or who can effectively recommend that they be hired or fired. Although foremen and other supervisors may organize into their own unions and attempt to win bargaining rights, the Taft-Hartley Act gives supervisors no protection in their efforts to secure collective bargaining.
- Swing Shift.**—An extra shift of workers required in establishments where continuous or 7-day operations are scheduled, to provide other crews with days off rotating among all the other shifts.
- Sympathetic Strike.**—A strike called in support of another strike.
- Taft-Hartley Act.**—See LABOR-MANAGEMENT RELATIONS ACT OF 1947.
- Target.**—A rate set, in piece-rate systems, with the objectives of making it possible for a worker to earn an agreed-on percentage above the base rate.
- Temporary Rate.**—A wage rate set tentatively on new work; also called "experimental" or "trial" rates.
- Time Study.**—Engineering analyses of time required to perform a job.
- Trainee.**—Term applied to workers who receive formal training for occupations requiring a limited degree of skill; the training may include some classroom work.
- Travel Time.**—Time spent by a worker traveling to and from a designated point and the place of work; includes portal-to-portal in mining, deadheading on the railroads, and out-of-town work performed by building tradesmen, mechanics, musicians, etc.
- Unauthorized Strike.**—A strike by employees against the advice or without the approval or sanction of their union, as a wildcat strike.
- Unfair Labor Practice.**—A practice forbidden under the federal or a state labor relations act. Under the Wagner Act, these were a list of prescribed activities of employers; under the Taft-Hartley Act, the list was broadened to include a series of activities of labor organizations as well.
- Unfair List (or "We-Do-Not-Patronize" List).**—The names of employers voted by a labor body to be "unfair to organized labor" because of their refusal to recognize a union or drawn-out refusal to reach an agreement with a union. During 1952, the Supreme Court of the United States confirmed an award of damages to an employer so listed by a central labor union.
- Union Insignia.**—Buttons, badges, or other insignia showing that the wearer is a union member, or a "paid-up" member. The right to wear these as an organizational tactic while on the job has been guaranteed by the NLRB.
- Union Label.**—An identifying mark, registered with a duly-constituted authority, placed on goods to show that they were produced by union labor or in a shop

which deals with organized labor and has the right to use the union label. Most union members pledge to give preference in their buying to products bearing the union label.

Union Rate.—An hourly wage rate, usually a single rate for an occupation or trade, established by agreement reached through collective bargaining. Usually the minimum rate that may be paid to qualified persons in the job; there are usually no restrictions preventing an employer from paying above the union scale.

Union Shop.—The strongest form of union security permitted under the Taft-Hartley Act. Under this, while the employer is not restricted as to who may be hired, all employees must become members of the union within a specified period of time and continue to be members in good standing. Illegal in states which have adopted "Right-to-Work" laws.

Union Shop Card.—Registered certificate issued by unions in the service trades indicating that the employer deals with the union and that his business is thereby deserving of the patronage of other union members.

Unit.—The "unit appropriate for collective bargaining," consisting of all employees entitled to select a single agency to represent them for collective bargaining.

Upgrading.—The process of a more-rapid-than-normal advancement of workers to jobs having greater skill requirements and commanding higher rates of pay. Characteristic of manpower utilization during a "tight labor market" such as prevailed during the latter years of World War II; the converse of downgrading.

Vacation Pay.—Payment for a period of time received by workers for vacation purposes. During busy times or in a tight labor market, workers may be given the option of accepting vacation pay in lieu of time off.

age Advance Plan.—Advancing of wages in short workweeks under plans obligating employers to maintain weekly wages up to a specified minimum level, as under an Annual Wage or Employment Guarantee.

age and Salary Administration.—The managing and supervision of the wage structure of an employer. Involves the application of wage and salary adjustments according to established policies, the analysis of such data as cost of living, prices, wage and salary surveys which have a direct bearing on the wage structure and on wage negotiations. May also involve the establishment of new rates through job evaluation, job analysis, and time studies.

age Assignment.—A voluntary transfer by a worker of some of his earned wages to another party or parties. May be for payment of purchased goods or debts, savings bonds, charitable donations, and union dues and assessments.

age Differentials.—Patterns of differences in prevailing wage levels have been discovered, based on a variety of factors, including differentials between skills and occupations, between regions, between sexes, between shifts, between organized and unorganized workers, between cities of various sizes, between industries, between areas, and between large, medium, and small-sized labor forces employed by single establishments.

age Inequalities.—An unjust disparity between wage rates of workers whose duties and responsibilities are similar or identical.

age Inequities.—An unjust relationship between the wage rates of workers or of job classifications.

age Leadership.—The influence exercised by the wage settlements reached by a large firm or group of firms on other settlements in an industry or labor market.

age Level.—The level of wages received by workers in an occupation, establishment, industry, or area, generally indicated by average wage rates.

age Policy.—A formalized practice of an establishment, association of employers, or industry relating to the elements of wages, such as wage rate scales, shift differentials, overtime provisions, nonproduction bonuses, automatic increments, paid holidays, paid vacations, pensions, and insurance benefits.

age Rate.—The monetary compensation for a given unit of time or effort by which a worker's pay is calculated.

age Reopening.—A provision in a union agreement permitting the question of wages to be opened for negotiation before the expiration of the balance of the agreement. Found usually in "long-term" contracts, but not in those in which automatic escalation is a provision.

age Review.—A periodic review of the performance of workers to determine or select those who deserve merit increases or advancement to higher paying jobs.

age Structure.—The sum total of the various elements and considerations that characterize a specific wage rate schedule in an establishment, industry, area, or the country as a whole.

age Survey.—A wage study based on the collection, tabulation, and analysis of original data. Wage surveys are of many types, and the kinds of data

collected depend upon the uses to which the surveys are put.

Wagner Act.—The popular designation of the National Labor Relations Act of 1935, which was sponsored by the late Senator Robert F. Wagner of New York.

Welfare Plan.—A feature of a collective-bargaining contract whereby specific benefits, such as insurance, pensions, medical care, and other matters are provided for employees. Employer contributions to funds for these purposes are regulated by the Taft-Hartley Act. Formerly such plans might be set up by employers or by unions; presently, if an employer elects to alter a previously existing plan, the alterations are a legitimate subject for collective bargaining.

Wildcat Strike.—A work stoppage which is not authorized or sanctioned by a union, usually to force action on accumulated grievances. Frequently a phenomena in certain plants during the period before contract negotiations "to show the boss the workers mean business." Usually a stoppage of short duration.

Workmen's Compensation.—Insurance programs, under state auspices or control except for federal employees and certain maritime workers, to provide financial provision for medical care and loss of wages and earning power resulting from industrial accidents and from sickness resulting from employment. See article WORKMEN'S COMPENSATION.

World Federation of Trade Unions.—Federation of trade unions throughout the entire world formed at the end of World War II. As a result of the increasingly obvious domination of the WFTU by the unions of Russia and the satellite nations, the unions of the democratic nations withdrew and formed the International Confederation of Free Trade Unions. The AFL refused to join the World Federation of Trade Unions.

Yellow-dog Contract.—An agreement once used by some employers as a prerequisite for employment wherein the prospective employee promised to refrain from joining a union while working for that employer; restricted by the Norris-LaGuardia Act, the courts have held that such contracts are not binding, since an individual cannot alienate his own right to join a union.

LABOR or TRADE UNIONS. In origin, trade unions are a consequence of capitalist development. Secondary similarities of function and practice between unions and the craft guilds of medieval Europe have inspired attempts to trace the direct descent of the former from the latter. A lineal connection, however, cannot be established. Basically, craft guilds and trade unions are comparable only as historical types of combination, corresponding to different stages of economic development and successive social systems. They are analogous, rather than related, associations.

CRAFT GUILDS AND JOURNEYMEN'S SOCIETIES

Craft Guilds.—The craft guilds, which appeared for the first time toward the end of the 11th century, followed the separation of industry from agriculture concomitantly with the rise of towns and the development of urban economy. Industry developed on the basis of handicraft production in small workshops to satisfy existing demand of definite customers in local markets, and hence separately from commerce.

The craft guilds were societies of artisans, comprising master craftsmen who were both handicraftsmen and the proprietors of workshops, owning the tools and raw materials used in production, directing the work, and owning and disposing of the finished product; apprentices; and journeymen, artificers who had completed their apprenticeship and occupied an intermediate position between apprentices and masters. By custom, guild regulation, and law, apprentices and journeymen were regarded as potential master

craftsmen; and all three were held to be, not distinct groups with separate interests, but necessary stages in the development of competent artisans. The guilds were controlled by the masters.

The craft guilds were essentially middle-class associations of handicraft producers. Their chief function was the protection of artisans against competition among themselves by minute, restrictive, and comprehensive regulation of all phases of production, and against competition from other towns by monopolistic control of local markets. The guilds corresponded to a precapitalist stage of economic development, in which, on the one hand, the functions of industrial production and commerce were discharged separately by artisans and merchants, and, on the other hand, the roles of producer and owner were combined in the artisan.

Growth of Merchant Capitalism.—More to the point in determining the precursors of labor unions are the journeymen's fraternities or societies, variously designated in different countries, which sprang up during the decay of the craft guilds. As markets widened, beginning in the 13th century, the growth of trade made increasing demands on production. The guilds were fundamentally alien to production in volume for extensive markets not subject to monopolistic control, but open to competition and entailing, therefore, individual initiative and hazards foreign to the nature of the guild system. Production, consequently, developed independently of, and in opposition to, the guilds; and resulted in the evolution of the capitalist mode of production. Merchants, who theretofore had served only as intermediaries between producers, promoting the exchange of commodities, began to take direct control of production, while at the same time, energetic and ambitious master craftsmen began to produce for wider markets, reaching out for control of commerce. Control of production and commerce were combined; merchants became manufacturers; producers, merchants; and both, capitalists. As merchant manufacturers were the predominant type of capitalist entrepreneur, it is customary to refer to both types as merchant manufacturers or merchant capitalists, and even merely as merchants.

At the same time that control of production and commerce were combined in the merchant capitalist, the artisan was stripped of ownership of the instruments of production, and the roles of owner and producer were embodied separately in employer capitalists and wage workers. The merchant manufacturers bought directly from independent handicraftsmen; contracted with master craftsmen for the output of their shops; and set handicraftsmen and peasants and their women and children to work in their own homes and in rented workshops. By these practices, the merchant manufacturers preserved the handicrafts as the technical basis of production. On the other hand, they also established a number of relatively large workshops in which hand machinery was used and division of labor within the workshop was instituted by the partial splitting up of a number of handicrafts into their component operations.

As in all these instances, the merchant manufacturers generally supplied the raw materials, invariably disposed of the finished product, and tended increasingly to supply the principal tools, master craftsmen were transformed into middle-

men between merchants and producers; and independent handicraftsmen, who continued nominally to sell their products, but disposed of them for prices which were determined by the merchant, and were, consequently, the equivalent of wages, became a type of wage worker; direct employees of the merchant manufacturers were wage workers.

Under the spur of increasing trade, which it, in turn, stimulated, the rising system of manufacture undermined the guilds. In the 16th century, following the emergence of a new world market in consequence of the epochal explorations and discoveries of the 15th century, manufacture became the prevailing form of industrial production, assuring the economic supremacy of the merchant manufacturers and ushering in the era of merchant capitalism.

Journemen's Societies.—On the journeymen, the impact of these developments was calamitous. All hope of their becoming independent producers vanished as the manufacturing system made necessary for the establishment of new enterprises larger amounts of capital than journeymen could acquire in the traditional way. Their access to mastership was made increasingly difficult and, in the end, virtually impossible by the master craftsmen who, in striving to maintain themselves against the subverting and encroaching influence of the new system of production, tended to make mastership exclusive and hereditary. Journeymen were deprived of representation in the guild assemblies, and were ejected from the municipal governments in which they held office. They suffered legal persecution and were frequently maltreated. Thus there took place in the guilds, beginning in the 14th century, a process of social differentiation which culminated in the 16th century with the divorce of the journeymen from the decisive instruments of production, in the transformation of the journeymen into wage workers.

In self-defense, the journeymen formed independent associations with their own officers and ritual, and with complete systems of initiation fees, dues, fines, and various benefits. They set high standards of workmanship and moral conduct for membership. The early associations, formed in the 14th century, were principally fraternal and religious in character. And while mutual aid continued to be one of the principal functions of journeymen's societies throughout their existence, broader functions were inevitably acquired by these associations. They appealed in vain to legislatures and courts to perpetuate the restrictive measures which had protected artisans against competition and other adverse factors. At the same time, they attempted to establish control over the placement of workers in shops. They resisted the efforts of the masters to increase the number of apprentices and reduce the number of better-paid journeymen. And they protested the debasement of working conditions and the extension of the workday which the masters instituted. When their demands were refused, the journeymen frequently were successful in withholding workers from the masters, occasionally on a citywide scale. They conducted sporadic strikes. The stronger societies tried, without success, to win control of the guilds; a number won a recognized place in the guilds. Everywhere, journeymen's societies encountered not only the opposition of the masters, but also the hostility of governments. They

were repeatedly prohibited, and continual efforts were made to suppress them. Persecution caused many societies to succumb, but new associations continually sprang up to replace those which perished because of governmental hostility or failed for other reasons. In general, journeymen's combinations persisted as secret societies. And as journeymen were transformed into wage workers, the combinations they formed became unions.

DEVELOPMENT OF UNIONISM

The first unions, created during the later stages of the period of merchant capitalism, gave abundant evidence of their historical origin. Indicative of their genesis was the frequent inclusion of "journeymen" in the names of the British and American unions and of its equivalents in the designations of unions in other countries. And, in fact, the unions of this period were combinations, in greater part, of journeymen who, although wage workers, were, as before, skilled handicraftsmen. They were exclusive associations, formed on a craft and, usually, a local basis. They exhibited little sense of solidarity with the workers of other crafts and trades and excluded semiskilled and unskilled workers, but frequently admitted to membership the artisan proprietors of small shops, who labored side by side with their workers, were often as poor, and, in consequence, were presumed to have common interests with them, especially against competing shops and the capitalists for whom they worked under contract. These early unions were concerned principally with the relief of distress among their members, and strove to increase the bargaining power and protect the interests of their members by controlling access to their crafts through limitation and strict regulation of apprenticeship, by establishing the closed shop,* and by maintaining and improving wage rates. They engaged in sporadic strikes. Like journeymen's societies, they came under the ban of laws prohibiting combinations of workmen, but many were tolerated. Essentially, these early unions were a transitional form of combination between journeymen's societies and modern labor unions. By some historians they are regarded as journeymen's societies; by others, as trade unions. But however designated, they are generally held to be the true forerunners of the modern trade-union movement.

The Factory System.—The trade-union movement is a consequence of the industrial revolution which occurred in England from about 1760 to approximately 1830 and in other countries at varying later dates; and which, in creating the factory system, transformed merchant capitalism into industrial capitalism. Production in factories, based on large aggregates of tools and workers, the application of power to machinery, extended division of labor in the factory, specialization of tools and operations, and improved means of communication, superseded handicraft production, which, however, survived but decreased greatly in economic importance. It gave rise, on the one hand, to a class of industrial capitalists who supplanted the merchant manufacturers as the controllers and directors of production, and appropriated in greater part the

function of the merchants in exchange. And, on the other hand, it brought to an end the role of the handicraftsman as the dominant type of industrial producer and transformed large numbers of handicraftsmen and immense numbers of peasants into the characteristically propertyless factory proletariat of modern times.

The factory system enormously increased production and productivity and enriched the industrialists. But it took a frightful toll in human suffering as men, women, and children were mercilessly exploited by employers who, in accordance with prevailing views, were without social obligations generally and virtually without responsibilities toward the human sources of their wealth. Caught in the grip of vast inimical forces which they did not understand, large numbers of workers tried to escape by striking blindly at what they assumed to be the cause of their misery. By riots and incendiarism they sought to destroy factories and machinery. (See LUN-DITES.) But such methods of protest proved ineffectual. With increasing understanding, workers learned to distinguish between machinery as a valuable instrument of production and the uses which employers made of it to the detriment of workers. The formation of coalitions of workers, intended to end competition among them and to pit their collective strength against their employers in the determination of working conditions, offered an alternative method of resistance, based on acceptance of the factory system as the existing form of industrial organization.

The Nature of Unionism.—Thus the modern trade union originated as an elementary form of organization of the working class created by the industrial revolution. Genetically, it was primarily economic. Its immediate interests lay in the field of industrial relations. And these pivoted on the relationship between workers and employers—labor and capital—in the process of production. As this relationship, however, constituted the basic social relationship of the rising industrial order, it influenced and was influenced by all the economic, social, and political processes of capitalist society. The impact of the unions, consequently, had necessarily to transcend the sphere of industrial relations, and unions inevitably had to react to all the influences affecting industrial relations. Potentially, therefore, their sphere of interest extended to the whole of society. And inherently, if only secondarily, they were also social and political, as well as economic, associations.

The connection between the economic and political interests of the unions was manifest at their birth. The first demands made by the unions did not challenge private property generally, nor private property in the means of production specifically, but strove only to abridge rights corollary to ownership by limiting the autocratic industrial power of employers. Under the law, all individuals were equal; and as equals, in accordance with the prevailing practice of freedom of contract, employers and workers entered into individual labor contracts to conduct the process of production. But legal theory did not correspond to economic reality; and employers, in consequence of their superior economic power as owners of the means of production, dictated the terms of employment to workers whose only marketable asset was their ability to work and who faced continuously the alternatives of work or imminent starvation. For

* Major principles of the closed shop are: (1) the employment of workers exclusively through the union; and (2) their discharge only for stipulated cause with the consent of the union.

dictation of working conditions by employers, the unions proposed to substitute collective bargaining by organized workers with their employers. They demanded principally standardized equal wages and shorter hours, especially for women and children. Essentially, these were protective measures and marked the unions as defensive associations rather than as aggressive bodies formed to assault the capitalist system.

Nevertheless, they affrighted employers and beneficiaries and proponents of the new industrial order generally. For, in attempting to circumscribe property rights and restrict freedom of contract, the unions impinged directly, with adverse affect on employers, on the source of profit and appeared, therefore, to threaten the foundation of the wealth and power of the industrialists. Furthermore, in seeking as collective bodies to influence industrial relations, the unions controverted the doctrine of *laissez faire* (q.v.) which held that the interests of society are served best when economic affairs are conducted in accordance with natural law (see *LAW, NATURAL*), by individuals and without restriction by human agency. Unionism thus appeared to challenge and imperil the very basis of social existence.

The unions were met, accordingly, by employers and governments with savage hostility. Unionists were blacklisted. Scabs and violence were used to crush strikes. Undercover agents were employed to disrupt unions. Existing statutes excluding combinations of workmen from freedom of speech and assemblage were invoked against the unions, and new laws outlawing them were enacted. Thereby the existence and, therefore, development of unionism was inseparably connected with basic political relationships, among which freedom of association was vital.

As in former times, legal prohibition proved powerless to prevent combinations, which workers persisted in forming under continuing economic necessity. Gradually, unions grew in size and extent, acquired legality and gained influence, and were recognized by custom and by law in most countries as necessary institutions with important economic and social functions.

THE MODERN TRADE-UNION MOVEMENT

Factors in the Development of Unionism.

—Three interacting complexes of factors shaped the development of unionism. The first was the evolution of capitalist society; the second, the nature of the working class; and the third, the level of working-class consciousness.

Among the principal factors in the first complex were the course of industrialization, the trade cycle of alternate prosperity and depression, subordination of national economy to the world market, governmental regulation of economy, assumption of broad social responsibilities by the state, the degree of civil and political liberty, nationalism, imperialism, war, conflicts between workers and employers and between workers and the state, fascism, and revolution. Important factors of the second complex were the character of the working class as primarily industrial or agrarian; and its economic, social, and ethnic homogeneity or diversity. The third complex comprised the degree of consciousness among workers of their separate interests in contradistinction to those of their employers, and of the basic identity of interest of all workers as workers; and their acceptance of various views relating to their role in society.

The cumulative effect on unionism of the operation and interplay of all these factors was the evolution of a worldwide movement marked by great diversity of structure and policy and sharp deviation in function, and lacking a uniform pattern of development.

Craft and Industrial Unions.—In the sense that industrialization tended to transform agrarian into industrial economies, it was fundamentally the same process in all countries in which it occurred and tended to have the same general consequences. However, as industrialization took place in various industries and countries at different times and varying tempos, its specific effects were necessarily extremely varied. It is true in a general historical sense that with the progress of industrialization, the formation of craft unions of skilled mechanics was followed by the creation of industrial unions which included primarily semiskilled and unskilled workers. But no correlation can be established between the level of economic development and types of union structure. In Australia, in which the economy is predominantly agrarian and organized on a large-scale capitalist basis, industrial unionism early became the prevailing type. Industrial unions were created in the United Kingdom, in large part, through the amalgamation of craft unions. In the United States, the most industrially developed country in the world, craft unions persisted, are stronger than in any other country, and are as strongly entrenched as industrial unions.

A correlation can be established in some instances between the level of development of an industry and the type of union structure. In the building trades in the United States, in which in contrast to the country as a whole, technological development is backward, craft unions predominate. Industrial unionism has long prevailed among the coal miners in the United States. In these respects the development of unionism in the building trades, coal mines, and a number of other industries in the United States closely parallels the rise of unionism in the same industries in other countries. On the other hand, craft unionism holds undisputed sway on the railways of the United States, while industrial unionism predominates over craft unionism in the British railroading industry. Moreover, with the progress of unionism millions of workers in various countries were organized in multicraft unions, a wide variety of unions intermediate between craft and industrial unions, multi-industrial unions, and general unions with extensive or unlimited jurisdiction.

A general historical causal connection can be discerned between the development of nationwide industries and communications systems, on the one hand, and the consolidation of local into national unions and the creation of national federations of unions, on the other hand. However, variations and exceptions are numerous. This is also true with respect to economic development and the extent of unionism. In agrarian Australia, for example, unionism in the 1880's was inclusive of virtually the whole working class. In the industrialized United States in 1920, unions embraced only approximately 21 per cent of wage earners exclusive of agricultural laborers and, therefore, a still smaller percentage of the entire labor force; 30 years later, unionism included less than 30 per cent of the labor force of the country.

Effect of Trade Cycle.—The impact of the trade cycle on unionism is well known. During prosperity, the demand for labor is at its height and competition among workers for employment at its lowest, creating a favorable condition for the growth of unionism. As a general rule, unionism advanced during periods of prosperity. During depressions, layoffs and wage cuts had a demoralizing effect on the working class and generally resulted in a decline in union effectiveness and membership; the first unions were destroyed by this process. In time, unionism found the means to survive, but it was nevertheless adversely affected during periods of general unemployment. Depressions were not the sole cause of decline, however. During the prosperity years of the 1920's in the United States, union membership fell by almost a third, from more than 5,000,000 to less than 3,500,000 on the eve of the 1929 crisis, after which it fell even lower. Nor are prosperity periods the exclusive occasions for significant union growth; for in Germany, during the period of economic ruin following World War I, union membership increased from approximately 8,000,000 in 1919 to almost 11,250,000 in 1922.

Development of Union Policy.—The development of union policy took place in the three closely interrelated spheres of economy, social relationships, and political relationships; and in its principal aspects, pivoted on attitude toward the working class, toward employers, and toward the state. Attitude was determined primarily by objective conditions, but also by purpose. The principal objective factors were contradictory influences inherent in capitalist society. In the realm of purpose, ideas often played a decisive role.

International Unity and Nationalism.—The extension of capitalist relationships on a world scale and the gradual integration of economy into a world economy to which the economy of all countries became subordinate, created objective premises for the unity of the workers of the world, for the adoption of common methods of struggle, and for the formulation by unions in all countries of identical basic policies. At the same time, nationalism, representing the separate interests of nations, exerted an overwhelmingly counteracting and divisive influence. Unions in all countries strove by strikes, collective bargaining, mediation, arbitration, legislation, and related fraternal, educational, and other institutional activities, and by political action, to improve working and living conditions. They declared their solidarity with workers and unions in other countries, often aided them with funds and in other ways, including sympathy strikes and boycotts, and joined with them in international federations. They also supported measures for the imposition of tariffs and the exclusion of immigrants. Unions in many countries reflected prevailing nationalist antipathies and racialist prejudices in excluding workers because of their national origin, color, or other similar reason; or in including them in segregated organizations; or in according them less than full union rights. In the supreme test of war, which is fought in great part by workers, unions almost invariably supported their national governments and declared a truce in the struggle against employers at home.

Results of Imperialism.—Imperialism—the oppression by industrially developed countries of

economically undeveloped or less developed countries which were transformed into colonies, semi-colonies, and dependent nations—had opposite effects on trade-union policy in the oppressing and oppressed countries. The prosperity accruing to the capitalists of the imperialist powers from the exploitation of the cheap labor of the colonial and semicolonial countries enabled them to make concessions to the working class at home. Thereby, the advance of the latter was conditioned on the degradation of the colonial peoples, and a premise was created for the identification of the interests of the workers at home with those of their employers with respect to colonial policy and, often, also in regard to related spheres of foreign and domestic policy. Although this effect was at times eclipsed, for example during strikes, by the consequences of the continuing opposition of interest between workers and employers, imperialism exerted, on the whole, a predominating, conservative, and—from the standpoint of the unity of all workers—corrupting influence on the unions of the oppressor countries. In the oppressed countries, imperialism retarded industrialization and, in consequence, the development of the native bourgeoisie and working class. By its oppression of both classes it created the basis for their alliance in national revolutionary movements for political independence and economic and social development. But in draining the wealth of the oppressed countries, imperialism drove native employers to overwork their laborers, intensifying the antagonism between employers and workers in the oppressed countries, and predisposing the workers to respond favorably to social-revolutionary influences. Generally, therefore, militancy and revolutionary political interests prevailed in the development of union policy in the colonial and semicolonial countries.

Influence of Ideas.—The principal ideational influences acting on union policy were a product of the historical process which engendered unionism and shaped its development. As members of society, workers are subject to, and tend to reflect in their thinking and attitude, the prevailing ideas of their time. Because the preponderant tendency of these ideas in capitalist society is the perpetuation of capitalism, union policy inevitably manifested attachment to the capitalist system.

The special position of workers in capitalist society gave rise in them, in accordance with varying circumstances, to varying degrees of consciousness of themselves as a distinct social group with specific interests. Among the notions, conceptions, doctrines, and theories constituting working-class consciousness, two broad conflicting yet intermingling streams of ideas were paramount. One, issuing in its fundamental aspects from the totality of prevailing ideas in capitalist society, affirmed a basic mutuality of interest between workers and employers; but, deriving also from awareness of the special status of workers, predicated improvement in their position on economic and correlative social and political reforms. From these sources sprang trade-union policies of collaboration with employers in the adjustment of labor relations; reliance on mediation, conciliation, and arbitration in the solution of labor disputes; aversion to the instinctive militancy and solidarity of labor; and, in extreme instances, abandonment of the strike weapon. From these sources also arose union

policies directed toward the institution of protective labor, and broader social-welfare measures through collective bargaining and legislative enactment; public education and public health; electoral and judicial reform; and other measures generally included in the program of industrial democracy and liberalism.

Utopian Socialism.—The second stream of ideas stemmed from a rejection of private property in the means of production generally and of capitalist society specifically, and projected a new social order based on communal ownership of the sources of wealth and principal instruments of production and exchange. In the doctrines of the Utopian Socialists, primary emphasis was laid on the voluntary organization of producers' co-operatives as the alternative to capitalism, and on the force of religious and ethical beliefs to secure the voluntary cooperation of the ruling classes in abolishing exploitation and poverty. Neither trade unionism nor political activity was central to their philosophy, but they were influential in both spheres. Their penetrating criticism of social injustice and their vision of a better world tended to enlarge working-class consciousness and, through it, to broaden trade-union policy. On the other hand, their philosophy tended to divert workers from direct struggle in industry and from political struggle, and militated against the development of class consciousness and militant trade-union policy.

Marxism.—In the theory of Marxism, or scientific socialism, or modern communism, the rejection of capitalist society is predicated on irreconcilable antagonisms of basic interest between labor and capital, between the working class and the capitalist state, between the proletariat and capitalism as a worldwide system of social existence, and on the culmination of the class struggle in proletarian revolution under the leadership of a political party on a world scale, as the inevitable prelude to a worldwide classless Communist society. Pivotal in the Marxian analysis of capitalist society is the conception that the inherent tendency of wages is to fall in accordance with the development of productivity, from which was drawn the conclusions that unions were, at best, effective centers of resistance, and that their chief value to the working class lay not in the achievement of immediate gains which must always be nullified in time, but as a necessary stage in the evolution of class consciousness. From this source flowed trade-union policies intended to extend unionism to the entire working class, to sharpen struggles with employers, and simultaneously to broaden them by drawing in larger numbers of workers, and to associate the unions with the revolutionary party. On this general basis unions were included in the First International or International Workingmen's Association, founded in 1864 and led by Karl Marx (q.v.), and were federated into the Red International of Labor Unions established in Moscow in 1921 as an integral part of the worldwide Communist movement led by the Third (Communist) International.

Reformist Socialism.—From Marxism issued the current of revisionist, or reformist, socialism, better known as social democracy, and commonly called socialism to distinguish it from communism or revolutionary Marxism. Reformist socialism was the product of imperialism and of the growth and progress of the trade-union movement in the imperialist countries; of the radical-

ization of large numbers of the middle class and of the intellectuals; and of other contributing causes. In essence, reformist socialism comprised two contradictory tendencies—the struggle of labor against capital, and the accommodation of the working class to capitalist society. It shared with Marxism the latter's rejection of capitalist society and its aspiration for a better social order. It repudiated the revolutionary conclusions which Marx drew from his analysis of capitalist society, and stressed the gradual transformation of capitalism into socialism by means of coordinated working-class economic and political activity. Like communism, reformist socialism held economic action by the working class to be essential but secondary to political activity. But unlike communism, for which political activity meant primarily revolutionary mass action, in the final instance against the state, reformist socialism construed political activity as parliamentary activity; it envisaged the capitalist state as the principal instrument of the transformation to socialism.

In union policy socialism tended toward conservatism and class collaboration, toward the achievement of immediate economic gains in preference to larger working-class ends, and toward close collaboration with Socialist political parties. In Germany, Austria, the United Kingdom, Belgium, Denmark, Sweden, and other countries, unions and social democratic parties constituted the economic and political divisions, respectively, of the Socialist movement. In consequence of this association arose in 1903, on the initiative of the Second, or Socialist, International, an international trade-union secretariat, which in 1909 became the International Federation of Trade Unions. Composed of autonomous national federations, the IFTU was, as a whole, nominally autonomous. It was, however, dominated by European social democracy, in particular by the German socialist movement, and it was throughout its existence the economic counterpart of the Second International.

Anarchism.—In anarchism, rejection of capitalist society was combined with absolute emphasis on the inalienable freedom of the individual from all restraint, which was in essence an extreme extension of the individualism inherent in the doctrine of *laissez faire*. In its application to unionism, anarchism became anarcho-syndicalism. Spurning struggles for immediate gains and denouncing participation in parliamentary activity as illusory and treasonable to working-class interests, anarcho-syndicalism stressed sabotage and other forms of direct action, antimilitaristic struggles, and, above all, the general strike as the means of conducting the class struggle for the overthrow of capitalism and its replacement by a classless society composed of communes freely united in the brotherhood of man. Unions in France, Scandinavia, the Netherlands, Italy, the Iberian Peninsula, the United States, Latin America, and Australia revealed the influence of anarcho-syndicalism at different times.

In consequence of the operation of all these and many other factors not included in the foregoing discussion, no element in trade-union policy can be correlated systematically with any other. Nor can trade-union policy as a whole be correlated with other aspects of unionism. No correspondence can be established, for example, between trade-union policy and structure. Essen-

tially identical policies were pursued by unions of different structure; divergent policies were followed by unions of identical structure; and varying policies were adopted at different times by the same unions.

Functions of Unions.—As with structure and policy, so with function. Unions originated as working-class instruments of industrial warfare, intended to resist the aggressions of employers and improve conditions immediately incident to work. In fulfilling this mission, unions developed many correlative functions. Owing principally to their special needs, but also to their exclusion from the pale of accepted institutions, unions developed distinctive codes of union ethics and law. Two antipodal tendencies found expression in union morality. One was the predominant motive of social conduct in capitalist society—material self-interest—disavowed only during wartime when individual sacrifice is extolled. The other tendency was the subordination of material self-interest to the common cause of all workers as workers—working-class solidarity. Among expressions of the first tendency are failure to undertake organization of unorganized workers, jurisdictional disputes among unions, and other practices which either deliberately or in effect predicate the advance of specific union interests on the neglect of, or opposition to, the interests of other workers. Demonstrations of devotion to working-class principles include the persistence of workers in strikes in which, owing to the prolonged resistance of the employers, the workers lose more in unearned wages than they gain, on victory, from increased rates; and sympathy strikes in which the unions supporting the original strikers have no prospect of direct material gain. Union law regulated the internal life of the unions and also included numerous working rules, which were embodied in large part in collective bargaining agreements and were eventually, in some instances, made the substance and even the text of statutory law.

From exclusive concern with wages, hours, safety, and other working conditions, unionism generally extended its active interests toward inclusion of all phases of industrial relations: unemployment, disability, and old-age insurance, and other forms of social welfare; and the reform of social and political conditions affecting industrial relations. (See *LABOR LEGISLATION*; *LABOR LEGISLATION, FOREIGN*; *SOCIAL LEGISLATION*.) At its farthest reach, the enlargement of union interest included the large questions of domestic and foreign policy; in these fields, however, the interest of unionism was, on the whole, more intellectual than practical, for despite the formation of national federations, unionism was not a unitary force on a national scale, except in the isolated and rare instances of national general strikes (as in England in 1926) which were, moreover, manifestations of working-class solidarity with embattled workers rather than concerted efforts for common aims.

The enlargement of union interest with respect to industrial relations and social welfare was effected in the terms of collective-bargaining agreements and in protective labor and social legislation. In industrialized western Europe the latter method was long supplemental to the former, and the extent and effectiveness of social legislation generally corresponded to the strength of the trade-union movement. In many Latin American and colonial countries, social legislation

was originally devised to harrass foreign capitalists and circumvent native unionism, and early exceeded in scope the comparable enactments of most other countries; while unionism, owing to the general lack of industrialization and of the working class, was weak, and was discouraged by the state and on more than one occasion was suppressed. In the United States both the trade-union movement and social legislation were relatively undeveloped until the advent of the New Deal administrations of President Franklin D. Roosevelt in the 1930's.

The increasing tendency of the state to regulate economic relationships, arising in part from the necessity to mitigate the effects of unbridled competition and its inevitable opposite, unrestrained monopoly, in part from the pressure of employers for policies conducive to their interests, and also in part from the demands of the working class for protection and reform, resulted in significant changes in union functions and in the endowment of unions with new functions. Under the compulsory-arbitration system of Australia, unions tended to become "litigious" organizations, concentrating their energies first on the preparation of claims for submission to the industrial courts which disposed of them, and then on policing the awards made by the courts. In England and other countries, unions became quasi-governmental bodies vested by law with responsibilities in the state regulation of industrial relations and in the administration of governmental social-welfare policy.

Unionism curbed industrial autocracy, limited freedom of contract, and abridged the rights of employers; it also gave millions of workers a sense of dignity, independence, and achievement, a measure of security, and a hope of a better life. In great strike struggles it gave inspiring evidence of the creative intelligence and inventive abilities, devotion to ideals, spirit of comradeship, and capacity for self-sacrifice which otherwise lie latent in the working class. Unionism was the principal instrument of the working class in rising from the condition in which it found itself at the inception of capitalism.

UNIONS UNDER TOTALITARIANISM

That was the function common to all trade-union movements prior to World War I. But then began processes of social development which, wherever they occurred, transformed unionism into its opposite. Fascism in Italy crushed the unions as independent working-class organizations and converted them into instruments of the corporative state; in Germany, fascism obliterated unionism. More important historically was the fate of unionism in Russia, where the unions had been created in great part and nurtured by the revolutionary movement. From the war, in consequence of the Bolshevik Revolution of Nov. 7, 1917, emerged a new social system in the territory of the former czarist empire. The capitalist system was overthrown, the principal means of production and exchange were nationalized, and a proletarian dictatorship was established. Workers control of production was decreed on Nov. 14, 1917. The revolution, declared the First All-Russian Congress of Trade Unions, meeting in January 1918, "has created entirely new conditions . . . especially for the trade unions." At the second congress, in January 1919, Nikolai Lenin (q.v.), head of the Soviet state and Communist Party, said, ". . . the trade

unions . . . in a certain sense . . . must . . . become the founder of the new society . . . The socialist revolution can only be accomplished by the . . . collaboration of millions of individuals in the government . . . The trade unions must educate the masses and lead them to share in the government of the country. That is why nationalization of the trade unions is inevitable." Simultaneously the close cooperation of the unions with the Communist Party, under the leadership of the party, was made the official policy.

Circumstances made impracticable the immediate conversion of the unions into state institutions. But in accordance with the official views, the unions were invested with supervision over workers control of production, and were charged with creation of the Supreme Economic Council, which was intended to regulate Soviet economic life, and with the organization of the Commissariat of Labor, which they consequently dominated. Through the Commissariat of Labor the unions exercised exclusive jurisdiction over the administration of the social-insurance, labor-protection, and work-placement provisions of the labor code promulgated by the Soviet government.

Following the outbreak of the civil war, in 1919, the unions were transformed into mobilization centers, and their military functions overlapped to some extent those of the Commissariat of War. Simultaneously, they were invested with a number of functions of the Commissariat of Supplies. The acquisition of still other functions made the unions an important factor in all spheres of Soviet economic and political life. They were in effect, if not in name, organs of the state.

With the introduction of the New Economic Policy in 1921, a partial reversion to capitalist economic relationships was instituted by the government in order to stimulate production. At the same time, the government reorganized industrial establishments into state trusts to be run on commercial lines under managerial personnel responsible to the state and exercising decisive powers in the determination of plant policy. Both developments effected important changes in the functions of the unions. Emphasis was now placed on the need to protect workers in the capitalist enterprises and against bureaucratic abuses in the state economic undertakings, and in the negotiation of collective agreements. But the unions were stripped of their role in the control of production. They were nominally permitted to conduct strikes, but were constrained to avoid suspensions of work and were obliged to participate jointly with management in the conciliation and arbitration bodies established by law to dispose of industrial disputes. The unions were made responsible for the maintenance of labor discipline; and were required to aid in increasing productivity, and to participate in the state bodies determining economic policy.

The inception of national economic planning in the form of the First Five-Year Plan in 1928 resulted in immense changes in economic, political, and social relationships, and resolved the duality in the functions of Soviet unionism. As the entire process of development pivoted on the drive for production, increased productivity, and lowered cost, and as it went forward under the whip of increasing governmental coercion, the working class was completely subordinated to the state, which became a totalitarian despotism.

The scope of unionism was progressively reduced by the extension of compulsory, or slave, labor under the absolute control of the secret police. The significance of collective agreements was nullified by the investment of directors of enterprises with power to fix wage rates within certain limits, to levy fines on workers for violations of labor discipline, and to exercise other forms of control, against which the efforts of unions in other countries had been directed for more than two centuries. The arbitrary arrest and punishment by the secret police of workers who signed their dissatisfaction, and the suppression of strikes by armed force, rendered the unions futile as organs of protest. They were incorporated into the state and their central function became the maintenance of labor discipline and the execution of the state's drive for production. Nominally, the Soviet unions continued to be organizations serving the interests of wage earners; in reality they became instruments for the subjection of labor. After World War II, as the Soviet social system was extended to the countries in eastern and central Europe which became its satellites, and to China and other Asiatic countries, the trade unions of those countries were also transformed into organs for the subordination of the working class.

By the middle of the 20th century, the trade union world was divided into two camps, reflecting the schism in the world between the two social systems represented by the capitalist powers and the Soviet Union. From the union in the capitalist world no influence extended into the realm of the Soviet unions; formal contact between the two trade-union worlds, established by their cohabitation in the World Federation of Trade Unions, which was established in 1945, was discontinued after the withdrawal of the unions of the capitalist world from the WFTU in 1949 and the establishment by them of the International Confederation of Free Trade Unions. From the Soviet world, ever since the establishment of the Soviet state in 1917, a continuous influence flowed by various channels into the capitalist world. Prior to World War II Communist influence in the capitalist trade-union world varied greatly, but was, on the whole, a secondary factor. After World War II, the Communist parties of a number of capitalist countries, notably Italy and France, gained control of the trade-union movements of those countries, thereby transforming the unions in those countries from organs serving the interests of labor—into coordinate instruments with the Communist parties and Soviet espionage agencies and diplomatic staffs, for the subversion of the capitalist social order and the eventual establishment of the Soviet social order.

The upshot of the deviation in function and of the great diversity in policy and structure among the unions of the world is the impossibility of formulating an analytical history of world trade unionism in terms of a single pattern of development. All the factors and influences which shape unionism are known. All are variable. The effect of each factor is manifested only in combination with other factors which augment, diminish, supplement, or offset its influence; and in each instance, whether it be a local trade union, an international union, a national federation, or an international confederation, the development of structure, policy, and function is the composite outcome of many

influences. Especially is this true with respect to national trade-union movements. Each resembles others in essential respects; yet each is unique. None is comparable with others; none is representative of all. Each, and therefore all, must be studied separately as a particular embodiment of common factors.

WORLD MEMBERSHIP

By 1950, more than 110,000,000 workers were organized in unions, and the number was increasing. From the following listing of the distribution of union membership, countries with less than 100,000 are omitted. All figures are rough approximations; some are incomplete. Fully half of all unionists were situated in the Soviet world, and more than half came within the direct reach of its influence.

Soviet Union	29,000,000	Brazil	500,000
United States	16,000,000	Portugal	500,000
Germany	9,750,000	North Korea	500,000
China	3,500,000	Pakistan	470,000
India	3,000,000	Norway	400,000
Poland	3,000,000	Argentina	400,000
Czechoslovakia	500,000	Peru	350,000
Mexico	500,000	Ireland	350,000
Australia	500,000	Bulgaria	350,000
Austria	300,000	Union of So. Af.	300,000
Rumania	1,300,000	South Korea*	250,000
Belgium	200,000	Finland	250,000
Netherlands	200,000	Colombia	200,000
Sweden	200,000	Ceylon	200,000
Canada	200,000	New Zealand	170,000
Hungary	900,000	Israel	170,000
Yugoslavia	650,000	Spain	160,000
Switzerland	600,000	Egypt	120,000
Uruguay	550,000	Philippines*	100,000
Cuba	500,000		

* In excess of figure show:

The principal federations were the anti-Soviet International Confederation of Free Trade Unions, claiming 48,000,000 members in more than 80 countries; the pro-Soviet World Federation of Trade Unions and its protégé, the Asian Federation of Labor, with a claimed membership in excess of 50,000,000; the counterpart of these federations in Latin America—the Inter-American Confederation of Workers, which reports a membership of 14,000,000, and the Latin American Confederation of Labor, supposed to have 4,000,000 members; and the International Federation of Christian Trade Unions, with a reported membership of about 3,000,000.

Analytical and statistical data will be found in *Studies and Reports*, published by the International Labour Office, and in the *Bulletin and Monthly Labor Review*, issued by the United States Bureau of Labor Statistics.

THOMAS STAMM.

LABOR VOTE. See VOTE, VOTERS, VOTING.

LABORATORY (from the Medieval Latin *laboratorium*, a workshop). The word is used to denote any room or building devoted to experimental investigations in techniques and the sciences for the purpose of advancing man's knowledge of special applications of natural law or of human physiology and mentality. Laboratories have been introduced into educational institutions to teach scientific and technical knowledge by means of experiments. The term is also used to denote the workroom of a manufacturing chemist, or the testing-rooms of an industry. In early times the nature of the chemical work of making drugs and potions was more or less disguised by the priesthood who called the place where they were made simply a workshop. Out of these early laboratories grew those of the Middle Ages. In this later period they were devoted to astrology, the making of drugs, potions and charms, and to the search for the philosopher's stone by means of which it might be possible to change the baser metals into gold. Some of these laboratories were very important in that day, being patronized by the nobility or maintained at the public expense.

Among the first laboratories open to students were those of Purkinje, who established a physiological laboratory at Breslau in 1825, and the chemical laboratory of Baron von Liebig at the University of Giessen in the same year. The first physical laboratories for students were founded about 1846; one at Heidelberg, by Philipp Gustav Jolly, and one at the University of Glasgow by William Thomson—Lord Kelvin.

Among the great laboratories of the world may be noted that of the Royal Institution, established in 1800 by Count Rumford, which was to be devoted to the applied sciences, but which soon became the seat of great activity in researches in pure science, conducted by such men as Davy, Faraday and Tyndall. The Physikalische Reichsanstalt, in Charlottenburg, near Berlin, was a very famous laboratory where there were departments devoted to research in pure science, and other departments for the study of the application of science to industrial pursuits.

In 1875 a committee for the standardization of weights and measures, made up of representatives of 18 nations, was organized for the purpose of reproducing and furnishing inter-

national metric standards to the members. A laboratory for their manufacture and for research was established near Paris. Great Britain has placed with the Royal Society the control of its *National Physical Laboratory*, where standards of weights and measures are to be kept, duplicates made, instruments tested and research is to be carried on. In the United States the Smithsonian Institution (q.v.) was established in 1846. Many important lines of research have been developed there, out of some of which have grown up some governmental departments, as the United States Weather Bureau and the United States Fish Commission. The United States government has established, by act of Congress, approved 3 March 1901, a National Bureau of Standards, a suitable building and equipment also being provided. The buildings and equipment have been added to until there are over half a dozen well-appointed buildings in use. The bureau has the custody of the standards of weights and measures, and has power to manufacture duplicates, multiples and submultiples. It also has the power officially to test and calibrate physical and chemical apparatus and issue certificates for them. A great deal of work is done in standardizing and calibrating physical, chemical and technical apparatus and machines for educational institutions, manufacturing plants and various governmental departments. Tests of commercial products are carried out and standard specifications adopted, unifying and in many cases simplifying them. Researches in pure and applied sciences carried on have been of the greatest importance in technical and commercial work. Especially have important results been attained during the World War, in solving such problems as the production of optical glass, increasing the production of fuel for internal combustion engines and aid in the further development of wireless telegraphy and wireless telephony.

In practically all American institutions of learning laboratories for studying science by means of experiment and for research have been established. In many preparatory schools, and in an ever-increasing number of high schools, elementary laboratories are included for the study of physics, chemistry and biology. Chemical laboratories for educational purposes were introduced by the Rensselaer Polytechnic Institute and by the Massachusetts Institute of Technology.

Industrial Laboratories.—Laboratories for research and testing form an ever-increasing part of many industrial enterprises. Materials are treated either chemically or physically or both at various stages of the processes of manufacture, these tests often indicating the subsequent treatment of the products. Still another is the laboratory maintained by a large firm making paper from wood pulp. As an illustration of the gains made by such laboratories it may be remarked that much of what was formerly cast aside in the making of pulp paper is now manufactured into products which increase the profits of the business. In the paper manufacturer's laboratory there are not only machines for testing every possible quality of the paper, such as its ability to resist folding and creasing and exactly to measure the weight necessary to break it, but also a complete chemical laboratory, whose chemist, after

years of experimentation, has found a means of making from a by-product of the paper a variety of charcoal much needed in clarifying certain drugs for pharmaceutical and other purposes.

Many industries of to-day are based on processes devised and worked out in laboratories for research. Some examples are the great plants at Niagara Falls, where metallic aluminum, calcium carbide, sodium hydrate and many other compounds are made. The basis of the progress in applied electricity is research in physics and chemistry. In many lines of industry scientific research in public and private laboratories has made possible new and better processes.

Notable examples of such progress are the recent developments in X-ray theory and apparatus, both wireless telegraphy and telephony, new alloy steels, chemical processes and products. The laboratory work done in the educational and technical chemical laboratories during the World War aside from purely war work have been of inestimable value in making the United States independent of foreign countries for certain products in which this country was previously almost entirely dependent. In those countries where there is the greatest activity in research in sciences and its applications there is also the greatest industrial activity. And it may be expected with confidence that in view of recent developments that many more commercial laboratories will be established and a greater degree of co-operation will be developed between the industrial and great educational laboratories.

Biological Laboratory.—Research in the biological sciences has helped to a better understanding of life and to its prolongation. The causes of many infections and contagious diseases have been discovered and effective methods of prevention and of combating them have been found. The Pasteur institutes in many large cities all over the world are witnesses to these facts.

In psychology research and laboratory tests have led to a better understanding of the limitations and adaptability of the individual for various lines of work. This matter has been brought to the attention of the world very forcibly in choosing men for various activities during these times of change and the lessons so learned will not be lost in peace times.

A general outline and some of the details of construction, equipment and uses of a few of the most common types of laboratories found in educational institutions and in industrial laboratories of the present day are given below. Many laboratories where excellent work is being done are very much simpler than those described; and, on the other hand, some are much more elaborate in construction and equipment. Some features are common to them all, one of which is the lecture-room, where experimental demonstrations are given before many students at one time.

Louis Agassiz led the movement in the United States in the establishment of biological laboratories, by establishing a zoological laboratory at Harvard.

Agassiz also developed the modern marine laboratory which has led to the establishment of many such laboratories in all parts of the world. The researches in these laboratories have been of greatest value in the biological

sciences. Among the marine laboratories of the world must be enumerated the great laboratory established in 1872 by Dr. Anton Dohrn at Naples. Specialists from all parts of the world go to this laboratory to do research work. The United States Fish Commission has established two very important marine laboratories in the United States: one at Woods Hole, Mass., the other at Beaufort, N. C., in 1899. Woods Hole was the centre of activity in 1871 and again in 1875. The first building of the present fish culture and experiment station was completed in 1884. This laboratory has been open to voluntary investigators, tables being assigned to them. The investigators have numbered among them men from the principal universities of the country, and much valuable work both of economic and scientific value has been done there. The marine laboratory established at Beaufort, N. C., promises to be one of the greatest, if not the greatest, biological station in the world; larger than the one at Woods Hole or the one at Naples on the Mediterranean.

Other marine laboratories are the Chesapeake Zoological Laboratory of the Johns Hopkins University, the Hopkins Seaside Laboratory of the Leland Stanford Junior University in California and the Tufts College Laboratory at Harpswell, Me. Another great biological laboratory is that of the Carnegie Institution at Cold Spring Harbor.

Many special problems in biology, in medicine and other branches are studied in laboratories such as the Crocker Cancer Laboratory at Columbia University. Investigation into physiological processes in health and disease has been in late years so highly specialized that individual physicians are no longer able to follow them up, even in their own specialty, but now send specimens obtained from their patients to the larger laboratories. One of the most famous of the biological laboratories is that of the Rockefeller Institute for Medical Research, which was founded by John D. Rockefeller in 1901, situated at 66th street and the East River in New York City. This institution, endowed with nearly \$3,000,000, contains pathological, chemical, bacteriological, pharmacological, experimental biological and experimental surgical laboratories, a hospital and an animal house. Animals are bred and farm products are supplied from a farm belonging to the institute and situated at Clyde, N. J., and an additional biological laboratory is maintained at Woods Hole, Mass. The institute publishes its findings in various branches of research through the media of its *Journal of Experimental Medicine* and in *Studies and Monographs*, issued from time to time.

A second very important marine biological laboratory for research exists at Woods Hole, where scientists from many institutions congregate. This laboratory is devoted entirely to research. There are many other important biological stations along the Atlantic, Pacific and Gulf coasts and a few on the Great Lakes.

The special appliances necessary to meet the needs of marine laboratories are boats, both large and small, nets, apparatus for obtaining the vegetable as well as the animal life of the salt and fresh water bodies and aquariums.

The researches of Pasteur in France on

bacteria have led to the establishment of important bacteriological laboratories throughout the world. The universities and colleges in the United States have many laboratories devoted to teaching and investigation along the different groups of the biological sciences.

The botanical laboratory is devoted to the study of the life of plants and their classification according to their distinguishing characteristics and structure.

The laboratories for the whole group of biological sciences have much equipment in common. The laboratory rooms should be well lighted, preferably with north light and with window bars done away with as much as possible; the building should be situated so as to have a low horizon. This is important in microscopic and microphotographic work, in order to get a uniform lighting of the slide on the microscope stage. The rooms should be provided with tables, on which is placed a full equipment of reagents, staining and preserving solutions. Dissecting instruments are among the individual needs of the students. Microtomes are needed for cutting sections, to be mounted on slides for examination under the microscope. The photomicrographic camera aids very materially in the careful, systematic study of specimens. The negatives thus obtained are available for making lantern slides for projection purposes and for making enlarged photographs. In some lines of research work, as in bacteriology, culture media, in which the particular form of life may grow and multiply, may be used. Often the cultures must be kept for hours at a certain temperature, thus necessitating incubators, of which the temperature is regulated by thermostats. Frequently rooms are set apart for cultures. Dark rooms are essential for the development of negatives resulting from the photographic work.

Chemical Laboratory.—The chemical laboratory is one of the most important factors in the educational and industrial systems of our civilization. The rooms of the chemical laboratory should be well lighted and ventilated. Special lines of work should be isolated. The lecture-room for demonstration purposes should be much the same in its general features as the physical lecture-room (q.v.). The lecture-room should be supplied with different gases, including common illuminating gas, oxygen and hydrogen. The oxygen and hydrogen are generally supplied in heavy steel tanks under high pressure. A demonstration lantern should be conveniently placed. The table top should have one or two holes in it connected to the suction fan for carrying off fumes and gases, thus keeping them from being disseminated through the room.

The inorganic laboratories, for elementary purposes, may be divided into three principal divisions: first, that devoted to the study of the simple reactions by the beginner, who there learns experimentally what takes place in the simple reactions, as that of the production of hydrogen gas by pouring sulphuric acid on zinc, forming zinc sulphate and liberating the gas. The second division is that part devoted to qualitative analysis, where more complex reactions are studied and where the student learns to recognize and to test for the presence of the different elements. Under the third division is found quantitative analysis, which, as the name

implies, is devoted to the study of the quantitative relations of compounds.

The work in these three divisions leads up to the more complex work of organic chemistry and research work. The equipment of these laboratories will give a general outline of the whole. Wide top tables should be provided. The tops should be impervious to water and as little acted on by acids as possible. Alberene stone is excellent material for such purposes. A good construction is to have the tops slope a little from both sides to the centre line, where a trough is placed to carry off the wastes to the sewer. Racks for the storing of bottles containing reagents should be placed so as to be easily reached by the students from both sides of the table. Beneath the top should be drawers and shelving so subdivided that each student may keep his apparatus separate. The tables should be provided with gas and water, with plenty of taps and with electrical connections. Means should also be furnished for boiling under reduced pressure. For the experiments where noxious gases are given off, hoods should be provided, the bases being of the same material as the table tops, the sides and top of fixed glass with a glass window that may be opened in front. For ventilation within the hood there should be openings to a flue connected with a blower which produces a suction of the gases from the hood. One of the openings should be well toward the top and the other at the bottom of the hood. If artificial lighting is required it should be from above the glass top. Plenty of stop-cocks for gas, water and suction should be provided for each hood.

Among the independent rooms needed are those for the following purposes: A hydrogen sulphide plant is an absolute necessity, and it should be isolated to the extent of having a well-ventilated room of its own. It should, however, be situated as conveniently as possible to the main divisions of the laboratory. Sometimes it may be advantageous to pipe the gas to different rooms. Near the quantitative laboratory should be a balance-room well stocked with analytical balances supported on solid tables or wall brackets. A combustion-room and a furnace-room are often required. The furnace-room should be so located as to get a good draft or so as to be connected to a suction fan system.

The study of the spectrum of gases makes it necessary to have a good induction coil to produce a spark spectrum, which may be viewed by the eye, or which may be photographed. The range of temperatures at which chemical phenomena are now studied calls for very high and very low temperatures, which means that the electric furnace and a liquid air plant are often desirable. Apparatus for distillation under different pressures and for obtaining constant temperatures are very necessary in some phases of the work. The rooms for gas analysis should be so situated as to make it possible to have but small temperature fluctuations. A north exposure, thus getting rid of direct sunlight and yet getting good illumination, is preferable. The principal part of the equipment needed for gas analysis by the Hempel method includes gas buretts, to measure volumes, absorption pipettes for the different reagents used to absorb different gases, combustion pipettes and oxygen generators.

The physical chemistry laboratory requires much apparatus and equipment needed in physics and in the other divisions of chemical work, including analytical balances, thermometers, barometers, manometers, calorimeters, thermostats, motors, stirring gear, refractometers, spectrometers, apparatus for studying polarized light, ammeters, voltmeters, resistances, and many other pieces. Among the subjects studied in the student laboratory are density, viscosity, vapor pressure, boiling and freezing points, heats of fusion and vaporization, critical temperatures, pressures and volumes, heats of combustion, solubility and the various divisions of electrolysis and electro-chemistry.

Electrical Laboratory.—The student and investigator in the field of electricity should have a thorough grounding in general physics and physical laboratory methods. The student in the electrical laboratory becomes acquainted with the relations of electric currents, electromotive forces and resistances; and the production and transmission of electrical energy, electrical quantity, capacity, magnetism and the relations between electricity and magnetism. The laboratory should be of strong construction on account of the lines of shafting and the heavy machines used. In the general laboratory will be found for purposes of investigation dynamos of the various direct and alternating current types; direct and alternating current motors, the latter covering synchronous, two-phase and three-phase motors, induction motors and rotary converters. Portable and variable inductive and non-inductive resistances; portable and fixed instruments for measuring current, electrical pressure or potential and power should be plentifully supplied. The fixed machines, instruments, the private rooms and tables should have lines of wire connecting them with a central switchboard through which any desired grouping of stations may be made. Among the separate departments may be one for testing and studying transformers; one for investigating the magnetic properties of iron, steel and other metals; a potentiometer-room in which to test and calibrate the instruments used in electrical measurements. Some interesting and important parts of the work are the investigation of the resistance and strength of insulators and conductors; the study of condensers and their effect in a circuit; the study of self and mutual induction and the measurements of them. Separate rooms which can be made dark, the walls of which absorb as much light as possible, or which can be made any color desired by a proper arrangement of coverings, where work in lighting and photometry may be performed, are also important parts of the equipment of an electrical laboratory.

The electrical engineering student should find it possible to make tests in all lines of his profession, approximating, as nearly as possible, actual working conditions in the commercial world. In order to give the greatest usefulness to the laboratory, the equipment should be kept abreast with the advances in the best engineering practice.

Engineering Laboratory.—Engineering laboratories have been developed within the past 40 years along all lines of engineering and technical education. The divisions are many, but only a few of them will be considered here.

The electrical engineering laboratory has been discussed above under the head of *Electrical Laboratory*. Under the division of Mechanical Engineering may be placed railroad engineering, marine engineering and the like. Among the subdivisions under Civil Engineering are mining engineering, hydraulic engineering, sanitary engineering and bridge engineering, for all of which laboratories have been developed.

The laboratory should be a solid structure with massive foundations for the heavy machines used. Boiler-rooms, engine-rooms, material testing-rooms and general experimental rooms on mechanical devices, are the requisites. The boilers tested comprise fire-tube, water-tube and shell boilers. Tests are made of fuels, as to their steaming qualities, the ash and flue gases, by means of calorimeters, gas meters, thermometers, thermo-elements and balances. Engine tests may be made on many steam motors comprising steam turbines, simple slide valve, Corliss and compound engines of high and low pressure types. For these tests are needed steam gauges, thermometers, indicators communicating directly with the inside of the cylinders, together with "reducing motions" for obtaining automatic records of the steam pressure within the cylinders during a complete stroke, from which data may be obtained by means of which to compute the energy put into the engine; and dynamometers to measure the output in useful work.

Another department is devoted to internal combustion motors. Under this class are indeed hot air engines, oil and gas engines, which require dynamometers, gas meters and air measurers of the fuel supplied, and means for testing the products of combustion. In the mechanical laboratory, water motors, fans, blowers, air compressors, compressed air machines and tools, different methods of power transmission, as by shafting, gearing, belts, ropes and chains and the like, are studied. Measurements of the coefficients of friction of different substances are found, and the effects of lubrication by different substances are investigated. Lubricants are tested under various conditions, such as at various temperatures, pressures and in the presence of different vapors or gases. The testing of materials is common to mechanical and civil engineering laboratories. It will be outlined under the latter head.

In the civil engineering laboratories, calculating and measuring instruments are tested and calibrated. Among these instruments are transits and levels, and all instruments having graduated circles, cross-hairs and spirit levels; steel tapes; chains and bars for measuring lengths; chronometers for measuring time; barometers and thermometers. Here also is studied the magnetometer; and by means of it the strength of the horizontal component of the earth's magnetic field. The variation and dip of the earth field are also investigated. The "acceleration of gravity" is determined.

In the hydraulic division of these laboratories are studied the flow of water in pipes, "skin friction," the flow of water through different orifices under different conditions, the flow of water over weirs and its measurement. This is very important in irrigation.

The laboratory devoted to the testing of materials is a very important one in all engi-

neering work. All kinds of materials used in engineering work are tested. The apparatus required comprises machines for testing the resistance to compression, of tensile strength, of torsion and flexure of materials. Cements are tested for their resistance to tension and compression and for the length of time required for them to set. For the last test named, automatic apparatus has been devised which registers time and amount of "set." Forms in which to mold the briquettes, and water tanks in which to immerse them for setting, are among the required equipment. Tests on concretes are made in a similar manner. Abrasion machines are used to make tests on paving material and other material subject to wear.

Physical Laboratory.—The housing and equipment of a physical laboratory is of very great importance. The building in which the laboratory is to be located should be so situated as to reduce to a minimum all jar and tremor, and to do away with all outside magnetic disturbances, such as those due to electric car lines.

Many rooms are needed for special divisions of the work; such as constant temperature rooms, which require special precautions in design and construction and which are best situated below ground. Special rooms are demanded for radiometers, spectrometers, potentiometers and such other instruments as require constant conditions to ensure good results. Dark rooms are necessary for work in light, which includes experiments requiring diffraction gratings, photometers and the phenomena of light in general. Since photography has become of very great practical importance, fully equipped dark rooms are desired; also a skylight room where enlargements and reductions of negatives may be made, and lantern slides prepared. It should be possible to introduce sunlight into some of the rooms.

A lecture-room in which experimental demonstrations may be given is a necessity, and much attention should be given to its arrangement. The lecture-room should be well lighted but should be provided with arrangements for readily darkening it. The experimental lecture table should be placed so as to be easily seen from all parts of the room. This table should have water, gas, air blast, suction, water motors and other motors, sink and terminals for obtaining direct and alternating currents. A solid masonry pier upon which to set up delicate apparatus and that requiring no vibration should be provided. The table tops should be impervious to water and so far as possible acid-resisting.

An apparatus-room in which is kept demonstration apparatus should be situated conveniently to the lecture-room; general apparatus may also be kept there. The opening between the apparatus-room and the lecture-room should be large enough to admit the passage of large pieces of apparatus, and also to allow experiments to be set up on wheeled tables in the apparatus-room, then wheeled directly into the lecture room.

Separate rooms should be provided for research work. It is desirable that it be possible to connect some of the rooms in suites, and to provide dark rooms for some of the suites.

Research-rooms should contain water and gas, both ordinary illuminating and acetylene

gas. They should have electrical connections to a central switchboard sufficient to obtain various types of current at one time. The floors of the building should be solid. Stone tables built in the walls form good supports for instruments, but there should be provided in some cases stone piers with independent foundations.

The general laboratories should have plenty of light and should be provided with separate rooms for some classes of work, as in light and sound, where it is often necessary to have darkened rooms. A heat bench or table should be provided; it should have an impervious top with enough pitch to drain into a central trough or hole to conduct away the waste. A rack with hooks above the bench, from which to suspend thermometers, is convenient. The rooms should be well supplied with tables, and along the walls stone shelving built in the walls will be found useful. The dirt incident to primary batteries may be concentrated if all the cells be kept together, their terminals leading to a switchboard to which are connected the terminals of lines leading to the various stations in the rooms.

The laboratory should also have storage batteries, and, if necessary, have its own dynamos in order to procure direct and alternating currents. An acetylene gas plant, and a compressor and liquefier for obtaining liquid air and other gases, are becoming necessary parts of the general equipment of a physical laboratory. A plant for the production of oxygen and hydrogen is also often desirable. A workshop in which to repair and build apparatus is a great convenience. The wiring and plumbing should be open and accessible as possible. All dark rooms as well as other rooms should be well ventilated, as it is often imperative for an observer to be confined in a room for hours at a time. Further reference to physical laboratory equipment will be found under the head of *Electrical Laboratory*.

Psychological Laboratory.—Since the establishment of the first psychological laboratory in Leipzig in 1875, by Wilhelm Wundt, where one room was devoted to apparatus and research, the development of the psychological laboratory has been rapid. One of Wundt's first students, G. Stanley Hall, established the first psychological laboratory in America at Johns Hopkins University in 1881, since which time many others have been started in the United States and foreign countries, including Japan.

The requirements of the psychological laboratory have increased very rapidly with the development of the subject, until its housing and equipment has become a problem of great importance and interest. Many rooms and much equipment are now required for a detailed study of the various expressions of conscious mentality. Beside the rooms necessary in teaching psychology by means of experiments, other rooms for research are needed. Quiet and relaxation being often necessary, it is important so to arrange the rooms that the work of one student will in no way interfere with that of another student. The separate rooms should be provided with gas, electric lights and water. Where absolute quiet is required, piping of all kinds should be excluded, the heating being done by indirect radiation if necessary, and only incandescent electric lighting being

used. The rooms should be wired for electrical intercommunication between those which may likely be desired to be used in suites where, as is frequently the case, the experimenter must be in one room and the "subject" in the other. They should also have wires leading to the rooms where chronometers and electrical recording devices are located.

For the study of the sensations of light and the eye, its capacity and limitations suites of rooms are desirable in many instances. These rooms should be capable of being either well lighted or darkened to any desired degree. The equipment of this part of the laboratory includes models of the eye and the muscles governing its movements, sectional models; apparatus for studying color sensations, color mixing, color blindness, contrast, brightness independent of the color sensation; apparatus for studying optical illusions, the sensitiveness of the retina at different points, the sensitiveness of the eye to changes in position, the sense of location and the imperfections of the eye; and apparatus for studying reactions and reaction times.

The sensation of sound requires isolated rooms where the noises produced may not reach other parts of the laboratory, and for certain parts of the work rooms that are sound and light proof. In this part of the laboratory the sensitiveness, range and analyzing power of the ear are studied. The equipment for the work in sound comprises models of the ear; instruments for producing sound, such as tuning forks, sirens, organ pipes and other sources of vibrations; and resonators for analyzing complex sounds.

Other rooms are needed for studying the sense of heat and cold, pressure, pain and the locations of the various end organs. The apparatus necessary is that required to produce the corresponding sensations. The effects of different sensations on the respiratory organs and heart action is another subject for investigation. Other parts of the laboratory are devoted to the senses of taste and smell. The equipment comprises the substances with which to test the various parts of the tongue, and also substances to produce different odors.

An essential feature of the psychological laboratory is a workshop where the many special forms of apparatus may be made, which are necessary to be used in the ever-changing problems which the scientific study of the conscious mind presents. Such a workshop contains a fairly complete equipment for both wood and metal working with a plentiful supply of power for running the machines.

Among the special pieces of apparatus necessary may be mentioned the chronometer, the chronograph, electrically driven tuning-forks, sources of mechanical and electrical energy and induction coils.

Aeronautical Laboratories.—The Central Establishment for Military Aeronautics at Chalais-Meudon near Paris led the way for aeronautical laboratories in 1884. A second was that of G. Eiffel, and a third that of de la Meurthe at Saint Cyr—the Aerotechnical Institute of the University of Paris. The Langley Aerodynamical Laboratory was opened in 1913. Other aeronautical laboratories which have been very productive are those at Göttingen, the English National Physical Laboratory, and the Bureau of Standards at Washington.

In these laboratories there are wind-tunnels specially constructed to give uniform wind streams at various velocities. In connection with these tunnels there are specially constructed balances to measure the lift and drag on wing surfaces, the resistances of parts and the forces on various shapes, and the retarding forces on airplanes as a whole. One very important laboratory established at the Bureau of Standards in 1917 is that for testing engines at reduced atmospheric pressures and the corresponding reduced temperatures simulating conditions for varying altitudes.

Municipal laboratories for the standardization of supplies bought by cities, such as asphalt, fire hose, food for various municipal institutions and many other commodities are maintained by several cities. These laboratories not only test what is supplied for the city's use, acquired through the purchasing departments, but also enable their agents to form more accurate specifications for further supplies. Water, coal, gas and other things for public use are submitted to regular examinations in such laboratories.

Y., 1931); Minot, 'Laboratory Construction' (Philadelphia Medical Journal 1900-01); Cajori, 'History of Physics' (1899); Sanford, 'Experimental Psychology' (1898); Scripture, 'The New Psychology' (1897); Titchener, 'Experimental Psychology' (1901).

ERNEST BLAKER,

Formerly Assistant Professor of Physics, Cornell University.

LABORDE, la'bôrd', **Léon Emmanuel Simon Joseph**, COUNT DE, French archaeologist and author: b. Paris, 12 June 1807; d. there, 25 March 1869. He accompanied his father, Alexander Louis Joseph on a journey to the Orient concerning which he wrote 'Voyage dans l'Arabie Pétrée' (Paris 1830-33), and was appointed secretary of legation at Rome (1828) and became (1831) Talleyrand's secretary at London, to fill later the same position at The Hague and Cassel. He was elected a member of the Academy in 1842. He became later curator of modern sculpture at the Louvre and (1856) director of the Imperial archives and was made a senator. Notable among his works are 'Histoire de la Gravure en manière noire' (1839); 'Voyage en Orient: Asie-Mineure et Syrie' (1837-62), with 180 plates; 'Le Parthénon' (1854), with 30 plates, but unfinished; 'De l'Union des Arts et de l'Industrie' (1856). He also wrote a number of works on the Paris libraries and monuments, etc.

LABORI, Fernand Gustave Gaston, fêr-nân gûs-täv gäs-tôn lä-bô-rê, French lawyer and editor: b. Rheims, 18 April 1860; d. 14 March 1917. He studied at the Rheims Lycée and for two years in Germany and England; took his degrees in the law faculty of Paris in 1881 and 1883, and was enrolled at the bar of the Court of Appeals in 1884; was secretary of the conference of advocates in 1887-88; took

a high professional rank; and was especially prominent as counsel for the defense in notable cases, as the libel action by Compayré against Numa Gilly, and the trials of the anarchists Duval and Vaillant. In 1898 he was chosen deputy for Fontainebleau. In the same year he defended Emile Zola (q.v.), accused of libeling the army and the President of the republic in the letter concerning the Dreyfus case. He was junior counsel to Demange in the defense of Dreyfus at the trial at Rennes in 1899, and thoroughly confuted his opponents by his logic and his brilliant cross-questioning. He did not make the final plea, but his 'Notes de Plaiderie' were published in the 'Compte-rendu Sténographique In-extenso du Procès Dreyfus a Rennes.' On 14 August, while on his way to the court, he was dangerously wounded by a revolver bullet fired by a fanatic or mercenary. He was shortly enabled, however, to continue the case. In 1903 he defended the Humbert swindlers (see HUMBERT SWINDLE) and in 1914 defended Madame Caillaux (see CAILLAUX; CALMETTE) and secured her acquittal. He was editor-in-chief of the judicial daily *La Gazette du Palais* in 1888-94; established the *Revue du Palais* and *Grande Revue* in 1897; and is joint author of 'Repertoire encyclopédique de Droit Français,' in 12 volumes (1898). See DREYFUS, ALFRED.

LABOUCHERE, lä-boo-shär, **Henry Du Pré**, English politician and editor: b. London, 9 Nov. 1831; d. Florence, Italy, 15 Jan. 1912. He was of Huguenot origin, was educated at Eton and Trinity College, Cambridge; was in the British diplomatic service in 1854-64, being at one time a member of the British legation at Washington; in 1865-66 sat in Parliament for Windsor; was then unseated on petition; but represented Middlesex in 1867-68 and Northampton in 1880-1906. During his parliamentary career he strongly advocated Home Rule. He was at one time part proprietor of the London *Daily News*, to which he contributed letters from Paris during the siege (1870-71). In 1876 he established and became editor of *Truth*, a weekly journal, in which he expressed his opinions with great vigor. The denunciations of all manner of public frauds in the columns of *Truth* brought him frequently into the law courts for libel, and though he almost invariably won his cases, he frequently lost heavily on them through being unable to recover costs from the unsuccessful litigants. He was an extreme Radical in politics, was a strong opponent of the South African War of 1899-1902, a man of cosmopolitan sympathies, and on account of his wit and incisiveness popular with all parties in the House of Commons.

LABOULAYE, Edouard René Lefebvre de, ä-doo-är rê-nä le-fävr lä-boo-lä, French publicist and jurist: b. Paris, 18 Jan. 1811; d. there, 23 May 1883. He studied law and in 1842 he joined the Paris bar. He was a close student of the great German writers on jurisprudence, whose works and researches he introduced to his countrymen in a series of able essays, written in an admirable style. The Academy of Inscriptions and Belles-Lettres crowned his 'Histoire du Droit de Propriété Foncière' (1839), and elected him to its membership in 1845. An 'Essai sur la Vie et les Ouvrages de Savigny' (1840), was followed by 'Recherches

sur la condition civile et politique des femmes" (1843). In 1849 he was appointed professor of comparative legislation at the Collège de France in Paris. He vigorously opposed the Second Empire, and ridiculed it in a thinly disguised form in *Paris en Amérique* (1863) and *Le Prince Caniche* (1868), two novels which were very popular. After the fall of the empire, Laboulaye was elected a deputy from Paris in 1871, and in 1880 became a senator for life. Others of his works are *Histoire des États-Unis d'Amérique* (1854); *Études contemporaines sur l'Allemagne et les pays slaves* (1854); *Souvenirs d'un voyageur* (1857); *Liberté religieuse* (1858); *L'État et ses limites* (1863); *Contes bleus* (1863), a series of admirably told tales, which were supplemented by *Nouveaux contes bleus* (1866).

LABRADOR, the name applied to that portion of the peninsula on the northeast coast of Canada forming part of the Province of Newfoundland. It is separated from the island of Newfoundland by the Strait of Belle Isle on its southeast coast. Its northernmost promontory juts into Hudson Strait; its east boundary is the Atlantic Ocean; while its south and west boundaries push wedgelike into the Province of Quebec. Prior to its inclusion with the island of Newfoundland, in 1949, as a part of the new tenth province of Canada, Labrador denoted the whole peninsula lying between Ungava Bay, in Hudson Strait, on the north, and the St. Lawrence River on the south. The changes in the territorial connotations and control of this region, from whence evolved its present status, are explained below (see section on *History*).

The name Labrador derives from the Portuguese word *lavrador*, meaning yeoman farmer, and its first application to the peninsula was made by John Cabot. In the early spring of 1498, on the eve of his second westward expedition which would take him to Greenland and the North American mainland, Cabot made a trip to Spain and Portugal. At Lisbon he conferred with a Portuguese mariner, João Fernandes, known as "Lavrador" because he owned a farm on Terceira in the Azores. Fernandes having described land discovered on a voyage west of Iceland, Cabot induced him to join his expedition. Accordingly, when Cabot made his landfall on Greenland he named it Labrador in compliment to Fernandes, and, supposing Davis Strait, separating Greenland from the continent, was simply a gulf, he saw no reason for giving another name to the peninsula.

The Land.—Labrador forms part of the Canadian Shield and is a great plateau of from 1,000 to 3,000 feet in height. The surface is undulating, with low ridges rising some 500 feet above the general level, and forms a barren mosaic of bare rocks, swamp and innumerable lakes. The plateau consists of ancient crystalline and igneous rocks and is also a potential source of many valuable minerals. Although the area has never been thoroughly surveyed, enormous reserves of high-grade iron ore have been discovered along the Labrador-Quebec boundary, which have been mapped out by the Labrador Mining and Exploration Company, a subsidiary of the Hollinger mining interests. Geological survey was commenced in 1938 over an area of 20,000 square miles in the Labrador territory and over an area of 3,900 square miles on the Quebec side, and huge deposits were found on both sides

of the border. The two camps cover iron formation for a length of 2.5 miles, and proven extent of this field places it among the greatest iron ore fields of the world. Its extent is not known, though the proven ore content is calculated to exceed 400,000,000 long tons in about 40 deposits. About two thirds of the discovery is located in Quebec territory and the remainder in Labrador. For the preliminary mining operations equipment was flown in as ground communications yet exist. In order to develop the area, it is proposed to build a road and a railway from the town of Seven Islands on the north shore of the St. Lawrence River to the lode zone near Burnt Creek, where the main camp for the five principal deposits is situated. In addition to iron ore, deposits of ilmenite, copper, zinc, nickel, mica, graphite and pyrite have been found.

In the extreme north the plateau is dominated by the Torngat Mountains, a lofty range of summits of which rise to over 5,000 feet. The coastline, bold and rugged, has promontories rising up to 3,000 feet directly from the sea. Most of the river valleys are heavily forested but a survey has been carried out to estimate the extent and value of the timber stands. The rivers are a potential source of wealth having many falls suitable for the development of hydroelectric power. The greatest of these is on the Hamilton River at Grand Falls, 200 feet wide and 310 feet high, or about twice as high as Niagara Fall. The drop in the 16-mile Grand Falls section amounts to 1,038 feet, and the drainage area above the falls alone is estimated to allow for an installation of up to 4,750,000 horsepower. Muskrat Falls has a potential capacity of 113,000 horsepower, and the drop between Grand Falls and Muskrat Falls another 1,000,000 horsepower.

Climate.—Although Labrador lies in the same latitude as the United Kingdom it has an extremely rigorous climate. The temperature may range from 60°F below zero to 60°F above. The summer is short, and snow usually covers the ground from September to June. In winter the whole coast line is blocked by ice.

Vegetation.—Information regarding the soil and vegetation of Labrador is very limited. Most of the coastal areas are barren and rocky and north of Nain this treeless zone extends far inland. However, mature forests, chiefly black spruce, have been noted along many of the river valleys, particularly around Hamilton River and its inlets.

Population.—The resident population of Labrador was computed in 1945 to be 5,525 including 700 Eskimos, 275 Indians, and 153 people of mixed Indian (or Eskimo) and European stock. The white settlers and the Eskimos live mainly on the coast in small settlements, the Indians are nomadic and live by hunting and trapping in the interior. The largest single community in Labrador is the air base at Goose Bay, 100 miles inland at the south of Lake Melville (Hamilton Inlet). The cod and salmon fisheries of the Atlantic coast provide the chief means of livelihood and income for the resident population of Labrador, with the fur catch second in importance. The furs are sold mostly through the provincial government and to the Hudson's Bay Company, which maintains posts at Northwest River and Cartwright.

Health Services.—Health services in Labrador are provided almost entirely by the Inter-

The Torngai Range in north central Labrador reaches heights of 5,000 feet.

International Grenfell Association, which maintains four nursing stations on the coast and three 25-bed hospitals, and operates a small hospital ship. These services cost about \$92,000 annually, and the grant is paid by the provincial government. Since World War II the Royal Canadian Air Force Hospital at Goose Bay has been available to people all along the coast, when other help is out of reach, and mercy flights to bring the sick to it are often made. The general health of Labrador is low and tuberculosis is prevalent.

Education.—Education in Labrador is carried on, as elsewhere in Newfoundland, in denominational schools maintained by government grants under government supervision. In addition, the International Grenfell Association operates boarding and day schools in connection with its missions at Cartwright, Northwest River and St. Mary's River.

History.—It seems to be fairly well established that as early as 1000 A.D. Norse vikings from Greenland, under Leif Ericson, landed somewhere along the coast of Labrador. The visits of these Norse adventurers had no direct tangible results, and the beginning of the 16th century found Canada still a vast virgin territory unexplored except by the aborigines who wandered over its plains and mountains.

The real discoverer of Labrador is acknowledged to be John Cabot who, on his second transatlantic voyage from England in 1498, cruised along the Labrador coast. It is only in comparatively recent years, however, that the coast of Labrador has been mapped to any accurate degree, through surveys conducted by the British Admiralty and the Hudson's Bay Company. The early navigators and explorers did little to promote occupation or settlement in this barren coastal area, and for many years the interior of Labrador continued to be a terra incognita inhabited only by nomadic tribes of Indians and Eskimos.

Historically, the control of the Labrador peninsula falls into three stages: *first*, from 1498 to 1763, when it was considered part of the Province of Lower Canada, the portion of New France that later became the Province of Quebec; *second*, from 1763 to 1927, the period of conflict between Quebec and Newfoundland—the Labrador Boundary Dispute; and *third*, after 1927, when Labrador entered on the process of becoming an integral part of the Province of Newfoundland.

Up to 1763, therefore, Labrador was regarded as being territorially part of the Province of Quebec, stretching eastward to the Atlantic Ocean, except for a narrow strip about three miles in depth along the coastal fringe that was officially acknowledged to belong to Newfoundland by prescriptive right. The Treaty of Paris, in 1763, defined the boundaries of Quebec, but a royal proclamation of the same year placed the coastal area east of a line from River St. John to Hudson Strait under the jurisdiction of Newfoundland. In 1774, however, all the territory claimed to Newfoundland in the foregoing proclamation was taken away from her and granted officially for the first time to the Province of Quebec. This act of 1774 was known as the Quebec Act and it became the basic law for the Province defined therein as the Province of Quebec. It included the French settlements along the St. Lawrence River and the eastern section of Labrador to the Atlantic. However, in 1809, another

royal proclamation was issued, whereby all this territory, except Magdalen Island, was re-annexed to Newfoundland. In 1825, yet another change was made. By an act of that year, a portion of the St. Lawrence River coastline of Labrador, extending eastward from River St. John to Blanc Sablon, a distance of 150 miles, was taken from Newfoundland and restored to Quebec. The jurisdiction of Newfoundland then extended along the Atlantic coast line from Blanc Sablon, in the Strait of Belle Isle, north to Cape Chidley, jutting into Hudson Strait. Newfoundland's right to jurisdiction, express or implied, over the portion of Labrador restored to her since 1809 was not questioned critically until 1900, when disagreement came to the surface as to Newfoundland's sphere of influence. This open disagreement led to what was thereafter called the Labrador Boundary Dispute. Year after year saw fruitless discussions between the two countries. No mutual understanding could be reached as to definition of boundaries. The boundary limits set forth in the various acts and proclamations already promulgated were so vague and indeterminate and capable of such widely differing interpretations that neither side could agree upon a settlement satisfactory to both parties. Ultimately, in 1922, both countries agreed on the final terms of reference to be submitted to the Judicial Committee of the Privy Council of the House of Lords in England—the final court of appeal for the settlement of disputes between overseas dominions of the British Commonwealth. In 1926 the case was submitted and on March 1, 1927, the judgment of the Privy Council was announced, upholding, almost in its entirety, the claim of Newfoundland. By this award, some 117,000 square miles of Labrador became definitely Newfoundland territory, with its greatest depth inland extending westward for about 400 miles.

From 1927 to 1949, the newly acquired territory was regarded more or less as a dependency of Newfoundland. It was not until 1945, when the discussions began that eventuated in the admission of Newfoundland as the new tenth province of Canada in 1949, that Labrador was granted political recognition in the Newfoundland Assembly for the first time. When the Province of Newfoundland was established, Labrador became an integral political unit with representation in the provincial Parliament.

R. H. TAIT,

Attaché, Canadian Consulate General, Boston.

LABRADOR DUCK, a rather small, black-and-white sea duck (*Camptorhynchus labradorius*), now extinct. It was allied to the eider ducks. It bred in Labrador and migrated in winter as far south as Chesapeake Bay, but was never very numerous and became extinct about 1875, leaving only some 35 specimen skins in the museums of the world. Its extinction seems not to have been due to excessive shooting or to disturbance of breeding places; rather, the race seems to have been waning, and an epidemic of disease or some weather disaster destroying many eggs and young may have been a final blow.

LABRADOR TEA, a kind of evergreen shrub (*Ledum groenlandicum*) growing in the northern latitudes of America and Europe, having alternate entire leaves clothed underneath with a rust-colored wool and producing hand-

some, white flowers in early summer. Labrador tea may also include the similar *Ledum palustre*, more generally called marsh tea or wild rosemary. The narrow leaves, which are fragrant when crushed, have been used as substitutes for tea, and were so used by Sir John Franklin in his Arctic expedition of 1819–1822. They possess narcotic properties, render beer heady and are used in Russia in the manufacture of leather, yielding an oil known to druggists as ledum oil.

LABRADORITE, a plagioclase feldspar of the albite-anorthite series, corresponding chiefly to $Ab_{10}An_{90}$. (See FELDSPARS.) It is, therefore, a silicate of aluminum, calcium and sodium. It has a hardness of 5 to 6 and a specific gravity of 2.73. It ordinarily occurs in cleavable or granular masses, or as an essential constituent of certain basic eruptive rocks, such as norite, gabbro, diabase, basalt, dolerite or andesite. In these it is associated with some member of the pyroxene or amphibole groups. Labradorite abounds in the Adirondacks, but its type locality is along the coast of Labrador, where it occurs in pure masses of enormous size.

LABRIDAE, a family of marine fishes, the wrasses, representing the highly specialized sub-order Pharyngognathi by a large number of beautiful and useful species inhabiting all the warmer seas, and traceable as far back as the Eocene period. These are brilliantly colored fishes, usually elongate in form and of large size, with cycloid scales and thick fleshy lips. There are powerful teeth on the margins of the jaws, but none on the palate; while the united lower pharyngeals are much thickened and form a plate beset with rounded, rarely sharply pointed, grinding-teeth. The upper pharyngeals are usually separate, bearing similar teeth. Jordan enumerates 60 genera and 450 species, "chiefly of the tropical seas, living among rocks or kelp." The type genus *Labrus* is almost wholly European. The principal genera represented in American waters are *Tautoglabrus adspersus* (cunners), *Tautoga onitis* (tautogs), *Harpe rufa* (ladyfishes), *Pimelometopon pulcher* (fatheads), and *Iridio* (doncellas). Parrot fishes, of the family Scaridae, are allied.

LABUAN, là-bōō-än', island, North Borneo, Malay Archipelago, situated 6 miles off the northwest coast of Borneo, outside Brunei Bay. Its greatest length is about 12 miles; greatest width 7 miles; area 35 square miles. The terrain is mainly low and marshy, and the climate is hot and humid, there being an annual rainfall of about 134 inches. There is a good harbor at Victoria, the capital, on the southeast side. The chief products are rice, rubber, sago, copra, livestock and fruits; much coal was formerly mined. The island was ceded to Great Britain by the sultan of Brunei in 1846; was administered by British North Borneo, 1889–1905; by the Straits Settlements, 1905–1946 (incorporated as part of Singapore, 1907–1912); occupied by Japanese forces, Jan. 20, 1942–Sept. 10, 1945; rejoined to North Borneo in 1946. The settlement also includes 7 smaller islands. The population is about one third Chinese, the rest Malay. The 1947 population estimate was 9,253.

LABURNUM, là-búr'nũm, a genus of trees and shrubs (also called GOLDEN CHAIN or BEAN

TREE) of the pea family (Leguminosae), all parts of which are poisonous to some animals. They are natives of southern Europe and western Asia, and are characterized by trifoliate leaves and brilliant yellow blossoms in pendulous many-flowered racemes produced during late spring and early summer. The larger species yield a very hard, heavy, tough, fine-grained, dark green or brown wood, which can be highly polished and is valued for inlaying, cabinet work, and turning. The species are also prized for ornamental planting in shrubberies, not only for their flowers, but also for their glossy foliage, which remains green until late in the autumn. No part of the plant is relished by insects, and all parts, but particularly the seeds, are poisonous to cattle. Nevertheless the young stems are greedily eaten by rabbits and hares, and may thus be made to serve as a sacrificial protection to other shrubbery. The best-known species, probably, is the English laburnum (*Laburnum anagyroides*), which sometimes attains a height of 40 feet but usually not more than 20 feet. It is hardy nearly as far north as Massachusetts. The Scotch laburnum (*L. alpinum*) is hardier, more erect and rigid, bears broader leaves and much longer and slenderer racemes of dark yellow flowers, and continues in blossom about two weeks later than the preceding. The most plentiful in the American nursery trade is the hybrid, *L. Watererii*.

LABYRINTH, a structure having many intricate, winding passages; specifically, the legendary labyrinth of Crete, out of which no one could find his way, but became the prey of the Minotaur. This Greek legend has been interpreted as a sun-myth, and in various other ways, but excavations in Crete since 1900 have shown its foundation in fact, and have localized the labyrinth beyond reasonable doubt in the ruined "palace" of the Minoan kingdom at Knossos, near Candia. Minos may probably be regarded as a title, like Pharaoh or Caesar, for a line of rulers; but the legend of the Minotaur seems to refer to an individual, Minos, one of the sea-kings of Crete, whose period was about 2000 B.C. This king's son, according to the legend, went to Athens to contend in the games, and becoming victor was murdered by direction of the Athenian king, Aegeus. Thereupon Minos sent a fleet which subjugated Athens. One condition of the peace was that thereafter, in every ninth year seven youths and seven maidens should be sent to Crete by Athens, to become the prey of the Minotaur—a monster half human, half bull. When the second time for this ghastly tribute arrived, Theseus, a hero of great prowess, volunteered to go. Arrived in Crete, he and his companions were immured in a great prison—the Labyrinth; but Ariadne, the daughter of Minos, enamored of Theseus, gave him a sword with which to kill the Minotaur, and a thread to unwind as he was led into the prison-maze, the means of which he could find his way out. The plan succeeded. Theseus and his fellow captives escaped, and the tribute ceased.

When the royal house at Knossos came to be excavated, first by A. J. Evans in 1900–1901, it was found, "with its long corridors and repeated succession of blind galleries, its tortuous passages and spacious underground conduits, its bewildering system of small chambers that it does, in fact, present many of the characteristics of a maze. Throughout the ruins

is and all other Minoan buildings, the design called the "double ax" is very prominent in decoration; and it is known that this symbol of divinity and royalty was named "labrys." The coincidence of this term with "labyrinth," together with other evidences of the connection of ideas, makes indubitable in the minds of antiquaries that the labyrinth of the legend was this very building. The chief god of the Minoan cult was represented as a bull. Once every nine years the reigning king was obliged to go into the Dictæan Cave (near the present town Lyttos) and renew communication with heaven. It is thought probable that human sacrifices may have been offered to the divinity in the cave on these occasions; that probably captives would be slain rather than citizens; and that the Athenian youths were destined to his sacrifice. Another theory is that vigorous war-captives were reserved for the national sport of the bull-ring, in which an athlete seized by the horns a charging bull, then skillfully vaulted to safety over the animal's back. Both men and women acted in this dangerous "bull-grappling"; and captives were probably kept and trained as toreadors for the amusement of the populace.

A vast and wonderful temple in Egypt, constructed by Amenemhat III at Hawara, about the time when the Minoan kingdom was in the height of its power, came to be called Labyrinth by the time Herodotus visited it, evidently in allusion to the similarly vast and complicated edifice at Knossos. More recent labyrinths are small, and often merely ornamental in their purpose. That at Clusium, in Italy, was erected by the Etruscans, according to Varro, for the sepulchre of King Porserna. Imitations of labyrinths, called mazes, were once fashionable in gardening. They were made of hedges; the best known is that at Hampton Court, near London. Consult for the Cretan labyrinth, besides the reports of exploration, Mosso, 'Nu Palaces of Crete'; Baikie, 'Nu Sea-Kings of Crete' (London 1913).

LABYRINTH, The. In 'The Labyrinth' (Le Dédale'), played in 1903, Paul Hervieu, the most logical and abstract of contemporary French dramatists, has developed a theme suggested five years earlier by Brieux in 'The Adieu' ('Le Berceau'). What, both writers ask, will be the results of divorce and remarriage when a wife meets again her first husband at the sick bed of their child? Will she revert to the first husband or remain true to the second? Will the husbands contend to the death or be reconciled? According to both playwrights, the wife's reversion to the father of her child is inevitable, but Hervieu has sharpened the conflict and given it a tragic conclusion. Marianne, having divorced her peramental Max, has married the brusque correct Guillaume. Max resents the rigorous education proposed for his son by Guillaume, and Marianne, to avoid legal complications, agrees that the boy shall visit his father. During this visit, little Louis falls ill, and Marianne, summoned to attend him, is thrown daily into a closest companionship with her former husband. In their mutual relief after an agony of anxiety, they forgot everything except their primal love. When Marianne confesses her love to her parents and to Guillaume, the

latter is enraged, but her mother excuses her deed as only natural. Since divorce is religiously unlawful, Marianne has never been truly wedded to her second husband. Guillaume is now ready to renounce her, upon condition that Max will do as much. But Max, refusing, taunts his rival; and, as the two men clinch, they fall from a cliff into the Rhone. Although the play is strongly emotional in its crises, it is little more than the illustration of an idea, every word and scene being nicely adapted to that end. Its characters live only to confirm the playwright's thesis. The piece was played in English in 1905; it may be read in the translation of B. H. Clark and L. MacClintock, published in 1913.

FRANK W. CHANDLER.

LABYRINTHODONTA, or **STEGOCEPHALI**, a group of primitive four-footed animals, forerunners of modern amphibians and reptiles, whose remains are found fossil in Peruvian, Carboniferous and Triassic strata, and which are the oldest known lung-breathing terrestrial quadrupeds. They were first discovered through finding their footprints imprinted in the Triassic rocks (Keuper beds) of Germany, long before the actual fossilized remains were brought to light. The footprints were described at first as those of a hypothetical form to which the name *Cheirotherium* ("hand beast") was given. As geological science and research progressed, the remains of the labyrinthodonts were discovered, when a comparison of their structure with the footprints showed that some of the latter were made by these creatures; many of the tracks, however, are unidentified. Later, when a great variety of related remains had been discovered, the term *Labyrinthodonta*, which relates to the curious "labyrinthine" infoldings of the enamel-wall of the teeth, was restricted to a single group or suborder (also called *Stereospondyli*) within the general amphibian order *Stegocephalia*. This suborder contains highly developed and mostly large forms, characterized by the complication in tooth structure above mentioned, and by co-ordinate anatomical distinctions. The principal genera are *Laxomma*, *Trematosaurus*, *Metopias*, *Capitosaurus*, *Mastodonsaurus* and *Labyrinthodon*, the last including the most recent forms of the Upper Trias, at the close of which period the group appears to have become extinct. See **STEGOCEPHALIA**.

LAC is the product of one of the scale-insects (*Coccus*, or *Tachardia*, *lacca*) of the family *Coccidae*, which is the source of an important Oriental industry. This species, like other scale-insects, multiplies with amazing rapidity, and feeds in compact colonies of tens of thousands, carrying the twigs of certain trees, especially the banyan or "religious" fig and related species of Ficus, the dhak (*Butea frondosa*) and some other trees in India and Assam, and on privet trees in Yunnan and Szchuen provinces in southwestern China. Inserting their beaks into the bark females of these insects suck the sap, a large part of which passes out as excrement, transformed into a sort of resin that accumulates over the insect's back and forms the "scale." The scales of the crowded insects coalesce at their edges into a continuous layer over the slender branch on which they are feeding, and such a branch, cut

off, is known as "stick lac." By tying a few of these sticks on fresh parts of trees the natives induce the insects to spread to and over fresh branches, and thus obtain two crops a year. The industry is a very ancient one and gives a living to a large number of people; and the value of lac products exported from India alone approaches 35,000,000 of rupees (about \$17,500,000) annually. The best lac comes from Bengal and the central provinces.

The original method of preparing the lac for use and market was by pulverizing the insect-covered twigs, at the proper time, and placing the fragments in hot water. This separated the scales from the wood, softened the resin, and dissolved the coloring-matter of their interior tissues, especially strong in the egg-sacks. The remains of the insects are then taken out and dried; and this operation of washing and drying is repeated until the resin from the melted scales is (or ought to be) entirely colorless. The mass is then put into a bag of coarse cotton cloth which is held near enough a fire to melt the lac, and is squeezed by twisting. The melted resin drips on small sticks arranged to receive it, and congeals into thin, light-colored, transparent flakes called shell-lac, the shellac of commerce. Large and small drops falling on the ground form button-lac, lump-lac, and so forth. Latterly this work has been done by machines made to grind the sticks, and melt and wash the material in steam-heated apparatus, which quickens the process and improves the product.

The water in which the first washings are made is deeply reddened by the dissolved coloring-matter in the insects. This water is saved, strained and evaporated, or cleared by the aid of alum, and the residue is deposited. This, when dried, is molded into cakes that furnish a rich dye. Previous to the invention of aniline colors this was very valuable, but now, like cochineal, it has nearly disappeared from trade. It furnishes, however, the basis of many "lake" tints among artist's colors, particularly the exquisite carmine-lake. "Lake" is a modified form of the Sanskrit (and modern Hindu) word *lak*, or *lac*, which means a hundred thousand, and here refers to the multitude of insects in a colony; it is also familiar to us in the financial term *lakh*, meaning 100,000 rupees.

Lac is of great value for making varnish, because easily dissolved, furnishing a hard coating susceptible of fine polish, and easily taking a dye. The Indian, Burmese and Chinese use it for making and coating ornaments, and various artistic objects, usually rich in color. It also enters into the composition of the fancy sealing wax sold by stationers, and serves other useful purposes; but it must not be confounded with lacquer (q.v.), an Oriental vegetable product that resembles lac, when applied as a coating of boxes, bowls, etc.

LAC, or LAK, from the Sanskrit *lakṣhā*, or *lakṣha*, that is, 100,000. In the East Indies it is applied to the computation of money. Thus, a lac of rupees is 100,000 rupees. A lac is equal to about \$36,500. A lac of Sicca rupees was equal to about \$50,000; 100 lacs, or 10,000,000 rupees, make a *crore*. In 1835 the British government remodeled the currency of India, establishing a more uniform system, and fixing the value of the rupee at 15 to the

sterling £—about 32 cents American; and in 1927 at 1s. 6d.—36½ cents.

LACAILLE, Nicolas Louis de, nē-kō-lōo-ē dē lā-kā-ē, French mathematician and astronomer: b. Rumigny, France, 15 March 1713 d. Paris, 21 March 1762. He was educated for the Church, but soon renounced theology for astronomy. He took an important part in the work of measuring an arc of the meridian, and in 1746 was appointed professor of mathematics in the Collège Mazarin. In 1751 he went to the Cape of Good Hope at the expense of the government, where he determined the position of some 10,000 stars with wonderful accuracy. At his departure from the Cape was delayed, he employed the interval in measuring a degree of the southern hemisphere. His works on geometry, mechanics, astronomy and optics were numerous. Among them are 'Leçons d'astronomie' and 'Astronomie Fundamentale'; 'Cœlum Australe Stelliferum'; 'Journal historique du voyage fait au Cap de Bonne Espérance'.

LACANDONES, lā-kān-dō'nēs, an Indian tribe living in Guatemala and Mexico. At one time numerous and powerful, they waged war against the whites. They are now about 300 left, of whom a part are friendly to the white people, though retaining their native customs.

LACAZE-DUTHIERS, lā'kaz-du'tyā **Henri de**, French comparative zoologist: b. Montpezat, 15 May 1821; d. Las Fous, 21 July 1901. He studied medicine at Paris and received (1854) the degree of professor of zoology at Lille, and was appointed to the chair (1865) of zoology at the Paris Museum of Natural History and (1868) at the university there. He edited, from 1872, 'Archives de zoologie générale et expérimentale,' and directed the Zoological Station at Roscoff, which he founded (1873) on the Brittany coast. In 1881 he started the *Laboratoire Arago* at Banyuls on the Mediterranean. For a number of years he devoted his researches to the study of the comparative anatomy of aquatic life, especially molluscs, and wrote, among other works, 'Histoire naturelle du Corail' (1864); 'Le monde de la mer et ses laboratoires' (1889). His letters to Alexander Dedekind appeared in 1902 (Paris).

LACCADIVE (lāk'a-div) ISLES, a group of small coral islands in the Indian Ocean about 200 miles off the west coast of Malabar and politically part of the Madras Presidency. They form 17 separate reefs, containing, however, but 14 islands, only 9 of which are inhabited. The surface soil is naturally so barren that there is little or no spontaneous vegetation on the majority of the islands, and their prosperity must ever depend on the cultivation of the coconut. The natives of these islands are a race of Mohammedans called Moplas (a mixed Hindu and Arab descent), are mild and inoffensive and dwell in low, thatched, stone built houses, and live poorly. Vasco de Gama discovered these islands in 1498. They were ceded to the British in 1792. Pop. 13,633.

LACCOLITH, lāk'6-lith, or **LACCOLITH** (Greek, "stone-pit"), a mushroom-shaped mass of molten rock which has been forced along bedding planes, between layers of sedimentary rock, and which has arched up the overlying beds into a dome. It differs from a sill in that a sill does not produce doming of the over-

ing bed. The Henry Mountains of Utah afford a famous example of a group of accoliths.

LACE, a cobweb background of threads with delicate patterns of flowers, figures and scrolls, also of threads, and used for ruffs, cuffs, collars, caps, scarves, handkerchiefs, ravats and aprons, and to trim articles of clothing, was first made in the 16th century. It reached perfection in the 17th and 18th centuries and deteriorated after the introduction of machinery. The word comes from *lakis*, meaning braid. The translators of the Bible used the word *lace* to denote braid. This definition survives in the gold and silver lace on uniforms and liveries. What is now called lace was anciently called "cut-work," "purls" and "points." It was also known as *passament* or *assement*; and *pasement dentelé* (from the French *dent*, tooth) occurs in the inventory of Henri II of France (1547-1559). *Dentelle de Florence*, occurring in an inventory of 1545, introduces the French word for lace—*dentelle*. The word *guipure*, applied to all large patterned and coarse laces which have no threads joining pattern to pattern and no delicate net background, was also anciently used for braid. The tape guipures of Italy and France were famous. Before the days of point-lace and pillow-lace people wore "cut-work" and "drawn-thread work," also known as *reticella*, *point gotico* and *needle-point gotico*. Its effect is much the same as that of diaphanous lace.

Reticella, or cut-work, originated in the Ionian Islands and spread thence to Italy and throughout Europe. *Reticella* was made from about 1480 to 1620. The patterns, handed down for generations, are stiff and geometrical and consist of circles, triangles and wheels, often decorated with tiny, spiky knots. *Reticella* was largely used for collars and cuffs and to edge ruffs and handkerchiefs. It appears in portraits of the 15th and 16th centuries and in old pattern-books. *Lakis*, which also antedated filmy lace, was the darned netting, or "spider-work," known as *filet*. It was popular in Italy. One of its names is "Siena Point." The pattern was darned with the needle upon a plain ground of coarse net. *Lakis* was made in squares and stripes and then joined. It was much used for household decoration. Catherine de' Medici had a bed draped with such squares. *Lakis* was sometimes combined with *reticella*, as the pattern book of Isabella Catanea Parasole (1616) shows.

Filmy lace appeared in the 16th century and in Italy. Antiquaries have sought in vain for its origin. It was probably an effort to imitate by woven threads the exquisite cut-linen that had reached perfection in Italy. There are but two classes of this diaphanous fabric: one, made with the needle; the other, with bobbins. The first variety is called *point-lace*, or *needle-point*; and the second, *pillow-lace*. *Point* takes its name from the French *point* (stitch). The French call it *point d'aiguille* (point of the needle). By extension, "*point*" has been given to a few laces of high quality to denote their excellence, such as *point d'Angleterre*, *point de valenciennes*, *point de Malines* and *punto di Milano*, which are not made with the needle, but with the bobbin (or pillow) laces. This produces confusion regarding the classification of

lace, already made difficult by the term pillow-lace instead of bobbin lace. As the pillow is also used for making *point-lace*, the name pillow-lace is misleading; but the classification of *point* and *pillow* is, however, too well established to admit of any change. The technical words used to describe lace are French. In both *point* and *pillow* the groundwork consists of a net of fine threads called *réseau*; or, instead of this *réseau*, slender threads called *brides* connect the patterns with each other. These *brides* are sometimes tipped here and there with little spiky knots, called *picots*. The edge, or border, is often decorated also with these *picots*. In some laces the background consists of both *réseau* and *brides*. The solid part of the design is called *toile*. In *point* there is but one kind of stitch,—the old familiar button-hole, or looped; and no matter from what country the lace comes, or how intricate, or how solid its pattern, or how fine its *réseau*, every stitch is the button-hole. If *brides* occur, they are also button-holed over, and if *picot* ornamentation is used, that, too, is button-holed over.

Pillow-laces are divided into two classes: (1) the pattern is first made on the pillow and the *réseau* filled in afterward; (2) pattern and *réseau* made in one continuous piece. Charles Blanc shows the difference as follows: "The dominant character of pillow-lace is the soft blending of its forms. The needle is to the bobbin what the pencil point is to the stump. The pattern softened when wrought in pillow-lace is depicted with crispness by the needle." Pillow-lace is produced by the intercrossing and plaiting of the threads which are rolled at one end around bobbins and fastened at the other upon a cushion by means of pins. Bobbins are elongated spindles, tapering and swelling into little handles. They are made of wood, bone, or lead. They vary in size according to the thickness of the threads; and the more delicate the lace the greater the number of bobbins. A pattern is pricked out by pins on the pillow to guide the worker. The pillow varies in size and shape.

Italian Point.—Italian Point lace, poetically called *Punta in Aria* (stitches in the air), was developed in Venice. The graceful scrolls and lovely flowers of the earliest lace resemble the arabesques of Persian ornament. Venetian Point is the richest and most beautiful of all laces. There are three classes: (1) Venetian Raised Point and Venetian Rose Point; (2) Venetian Flat Point (including the famous Coralline), and (3) Venetian Grounded Point (including *Punta di Burano*). Venetian Raised Point has large fantastic flowers issuing from rich scrolls and foliage in the Renaissance style. These designs are outlined with a heavy, padded thread, called *cordonnnet*, button-holed over. The designs are connected by *brides* and often decorated with *picots*. Rose Point has smaller patterns and more *brides* and more *picots*. It has a whirling, snowy effect and is also called *Point de Neige* in consequence. (2) Venetian Flat Point has no *cordonnnet*; but *brides* and *picots* are plentiful. Coralline Point represents a tangle of seaweed; and, though lacking in clear outlines, is extremely beautiful. Venetian Grounded Point has a net background. It was inspired by the new *Point d'Alençon*, which the

French had created in imitation of Venetian Raised Point. The pattern of Venetian Grounded Point is usually the lily and the edge is a shallow scallop. It has a *cordonnnet*, stitched down around the outline of the pattern. Burano was the chief place where this Grounded Point was made, and it was manufactured there until the beginning of the 19th century. In 1872 Burano lace was revived under the patronage of the king and queen of Italy. The Burano makers copied the *Point d'Alençon* designs and also the square mesh of the *réseau*. The unevenness of the thread gives Burano ground a somewhat cloudy appearance, which aids in identifying it.

Italian Pillow Lace.—Milan and Genoa were also famous marts for lace. The most beautiful of all Italian pillow-laces is *punta di Milano*, or Milan point (the name describing the quality). The tape pattern was made first and the ground net-work filled in afterward. The meshes of this net are diamond shaped with a plait of four threads. The Genoese lace was of two kinds: (1) a "tape guipure," the tape arranged in spirals connected with *brides* and decorated with *picots*, and (2) pointed scallops decorated with little ornaments called "wheat-ears." Genoese lace was much used for collars and cuffs and appears in portraits by Rubens, Van Dyck, Rembrandt and Frans Hals, as well as in portraits by Italian masters.

French Point Lace.—"Venetian points," or "points," were bought by the wealthy and fastidious of high degree throughout Europe. To encourage home industry, Colbert, Prime Minister of Louis XIV, established a school at Alençon with lace-makers from Venice. *Point d'Alençon* was at first an exact imitation of Venetian Raised Point; but after a time the French invented a beautiful *réseau* in imitation of the bobbin net-work ground of Flemish lace. This was an entirely new idea, for point lace had never before been grounded on net; and, as noted above, the Venetians, hoping to win back their trade, imitated the *Point d'Alençon* in their Venetian Grounded Point, or *Point de Venise à réseau*. *Point d'Alençon* is called "the Queen of lace." It was first made in 1665. By royal decree it was called "*Point de France*." The effect of this lace is delicacy; but the wonder of it can only be appreciated by applying a magnifying-glass. How human fingers can execute such delicate and minute stitches is beyond understanding. The average size of a diagonal taken from angle to angle in an Alençon hexagon is about one-sixth of an inch and each side of the hexagon is about one-tenth of an inch. An idea of the minuteness of the work can be gathered from the fact that a side of the hexagon is overcast with 9 or 10 button-hole stitches. One characteristic of *Point d'Alençon* is a heavy outline (*cordonnnet*) button-holed over horsehair, which makes it firmer and heavier than any other fine lace. The designs are flowers, foliage, scrolls and arabesques, in the style of the decoration of the period. Spots, tears, sprigs and insects were used for designs in the days of Louis XVI. The factory became extinct during the Revolution. It was revived by Napoleon, when Bonaparte bees were used for motives in combination with flowers. This superb lace has always commanded fabulous prices. The Empress Eugénie had a dress of *Point d'Alençon*, for which

Napoleon III paid 200,000 francs (\$40,000) in 1859. In later years she gave it to Pope Leo XIII, who wore it as a rochet.

Argentan was established at the same time as Alençon and also produced lace in imitation of Venetian Point. It can only be distinguished from Alençon after Alençon adopted the *réseau*. Argentan kept to the *bride* ground of a six-sided mesh worked over with button-holed stitches. The large *bride* ground could support bolder and larger flowers and in heavier and higher relief than the *réseau* ground. The *bride picotée* is also a characteristic of the Argentan Point. Checked by the Revolution, it was revived in 1810; but in 1830 cotton, instead of linen thread, was used and debased the quality. Argentan Point became rare about 1858 and the secret of making it was lost in 1869. Although France borrowed the technique of lace-making from Italy, she put her own stamp upon it, and gradually brought it to such perfection that both *Point d'Alençon* and *Point d'Argentan* enjoyed enormous vogue. Other workshops were founded at Le Quesnoy, Arras, Rheims, Paris and Sedan.

French Pillow Lace.—Ten years before Colbert made French lace such an item of trade Le Puy had become a centre for lace-making, and the Duchesse de Longueville, Condé's sister had established lace-makers at Chantilly. Le Puy was the oldest lace-centre in France. It was noted for its thread laces and silk guipures. These guipures were made in bands, for which designs of geometric character, squares, stars and formal blossoms were used. Some of the Le Puy laces were known as "guipures de Cluny," from the Cluny Museum in Paris. Flax, silk, worsted, goat's hair and Angora rabbits' hair were used with equal facility at Le Puy.

Valenciennes is the most beautiful of all French pillow laces. Bobbin lace was made in Valenciennes in the 15th century, when the town belonged to Flemish Hainault. After Colbert founded Le Quesnoy the lace industry at Valenciennes revived and supplanted that in the neighboring town. Owing to the number of bobbins required, Valenciennes was the most expensive of all pillow-lace, though the workers who sat in dark cellars from four in the morning until eight at night, with only a little light concentrated on the pillow, received but a few pennies a day. Many went blind. A piece of lace "worked all by the same hand," therefore, was rare and commanded a large sum. In the town was made what the trade called "true Valenciennes" and in the suburbs "false Valenciennes" was produced. At the Revolution many workers fled into Belgium and settled in Alost, Ypres, Ghent, Menin, Courtrai and Bruges. Every town made a characteristic *réseau*. Valenciennes was revived, but the modern productions are not so fine as old Valenciennes. In the 18th century Valenciennes was much used for ruffles, cravats and trimmings. It was not regarded as a lace for full dress, nor was it a Church lace. Valenciennes is all made in one piece, the threads forming a continuous *réseau* and *toile*. There is no *cordonnnet*. The *réseau* is composed of circles in the earliest examples, but of squares in later examples. The flowers in early examples are tulips, anemones, iris, or carnations and have almost the appearance of cambric. Later specimens usually have

LACE

scalloped border containing a leaf, petal or other, and the *réseau* is sprinkled with dots. Machinery has imitated this lace very successfully and a vast amount of it is sold. It is commonly called "Val."

Chantilly.—Chantilly was also famous for lace. After having produced lace of second-rate value of the Valenciennes and Mechlin type, Chantilly suddenly achieved reputation by making silk lace, especially black. The material used was a silk, called *grénadine d'Alais*. The peculiar twist in spinning these threads so finished the lustre that people frequently imagine Chantilly is made of flax, dyed black. The *réseau* is a six-pointed star, known as "*ond Chant*," an abbreviation of Chantilly, then used by other workshops. Chantilly also used the Alençon ground and sometimes used the Alençon and the *Fond Chant* in the same lace. The patterns of old Chantilly (whether white or black) were often of vases of flowers and other decorations similar to ornaments

on Chantilly pottery. Chantilly lace ceased to be made during the Revolution, but was popular again under the Empire, when "blonde" lace came the rage in Paris. Chantilly was first made in bands and invisibly joined. After 1840 (in the reign of Louis Philippe) it enjoyed great favor and large pieces were made, such as shawls, fichus and bridal-veils, and smaller articles such as "*barbes*," parasols, handkerchiefs, fan-mounts, etc. In the days of Napoleon III flounces and dresses and other articles of Chantilly were made even more popular by the Empress Eugénie and they found a large market among wealthy Americans. In 1870 the workshops became bankrupt. Modern Chantilly is made at Calvados, Caen and Bayeux.

Bayeux.—Bayeux made exquisite black lace in which the elaborate patterns of flowers and other ornaments are rendered with the utmost accuracy of shading. At first Bayeux made lace in the Venetian style, then it followed the styles of Chantilly, and so beautifully that experts are led to tell the difference. Many so-called "Chantilly shawls" were made in Bayeux, but none the less valuable for that.

Blonde.—Blonde lace came in fashion about

1660. It was made of unbleached silk imported from Nankin, whence the name "nankeen," as well as "blondes." Soon the French made it of white and black silk. Marie Antoinette gave it special vogue. Blonde lace was made at Chantilly, Le Puy, Bayeux and Caen.

It was almost made in her own lace; but Spanish blondes do not equal those of Chantilly and Bayeux. Of blonde are made the Spanish mantillas that so gracefully drape the heads of the Spanish women. Those of white are worn on full dress occasions only; black is used for "second-best." During the Second Empire, owing to the taste of the Empress Eugénie, the big Spanish floral designs were made in the French workshops. These terms have never gone out of favor.

Spanish Lace.—Spanish blonde is the local lace of Spain. Barcelona early attained reputation for it and is still the centre for its manufacture. Comparatively little is known regarding Spanish lace, for it has not been studied thoroughly as the lace of other countries. We know, however, that cut-work (*reticella*) laces were made in Spain in the 15th and

16th centuries and that "Spanish Point" was as celebrated in its day as the "Points" of Italy or France. Regarding it Mrs. Palliser says: "The sumptuous Spanish Point, the white thread arabesque lace, was an Italian production originally. It was imported for the Spanish churches and then imitated in the convents by the nuns, but was little known to the commercial world of Europe until the dissolution of the Spanish monasteries in 1830, when the most splendid specimens of nuns' work came suddenly into the market, not only the heavy lace generally designated as *Spanish Point*, but pieces of the very finest description (like *Point de Venise*), so exquisite as to have been the work only of those whose time was not money and whose devotion to the Church and to their favorite saints rendered this work a labor of love." A great deal of fine lace went to Spain from Flanders; for in the 16th century Flanders was a part of the Spanish domain and the Emperor Charles V, therefore, ruled both countries. He, a native of Ghent, preferred the Netherlands to Spain and brought here as much of his native atmosphere as possible. Tapestry-weavers, lace-makers, embroiderers, furniture-makers and other artists were transported in large numbers and Spanish workers were also sent to the Netherlands. Consequently, there was an interchange of styles between the two countries.

Flemish Lace.—Flanders was superior to all other countries in its flax and the fineness of the linen thread the people were able to produce. An immense quantity of bobbin (or pillow) lace had been made in this country from an early period, and also "tape guipure" (the tape following the lines of the pattern and connected by *brides*), lightened by holes called "bird's eye" (single, or arranged in groups). As soon as Alençon began to succeed, Flanders began to make artistic needle-point, too.

Brussels Point and Pillow.—The Needle-point made in Brussels from about 1720 closely resembled Alençon in pattern and in general effect; but it was not so firm, and the *toile* was looser than Alençon and the button-hole stitched *cordonné* (so distinctive of Alençon) was absent in Brussels. The fineness of the thread was almost fabulous.

It had to be spun in dark, cold, underground rooms, for light and heat were said to hurt it. The earliest patterns of Brussels Point resemble the Venetian and the Alençon designs; and as Brussels lace enjoyed such patronage at the French court it followed the ornamentation in fashion. Brussels lace of the days of Louis XIV shows the designs of Marot, Berain and Lepautre; in the days of Louis XV zig-zags, pagodas and Chinese figures appear; then come leaves and flowers (particularly the pink, tulip and rose), insects, birds, trophies, feathers and striped ribbons of the Louis XVI period; and then the pseudo-classic motives of the Napoleonic period, as well as flowers, sprigs, wreaths, columns, stars, crosses and spots. The palm and pyramid were also frequent during the empire. Brussels Needle-point was and is still known as *point gaze*. It is famous for the variety of its patterns, the great diversity of the "fillings" between them and its marvelous firmness. There were two kinds of grounds: the *réseau* (or net) and the *bride*. Sometimes, too, *réseau* and *bride* grounds are mixed in the

same piece. The *réseau* was made in two ways — by needle and with bobbins. Hence Brussels is sometimes both a *point* and a *pillow-lace*. There are also two ways of producing the flowers and other ornaments — with the needle and with bobbins. When the ornaments are made with bobbins on the pillow, the lace is called *point plat*. In old lace the plat flowers were worked in with the ground, for the "applied" method was unknown. "In the modern *point gaze*," according to Mrs. Palliser, "the flowers are made with the same thread as the ground (as in old Brussels). It is made in small pieces, the joining concealed by small sprigs, or leaves. Brussels *point de gaze* is the most filmy and delicate of all point-lace. Its forms are not accentuated by a raised outline of button-hole stitching as in *point d'Alençon*; but are simply outlined by a thread. The execution is more open than in the early lace and part of the *toile* (heavy part of the design) is made in close and part in open stitch to give an appearance of shading. The style of the designs is naturalistic." The introduction of machine-made net (*nulle*), the famous "Brussels net," gave a new impetus to Brussels *point-gaze*, for the substitution of a machine-made for a hand-worked ground diminished the costliness, and such large articles as shawls and bridal-veils were multiplied. The flowers and other ornaments, after being made by hand, were applied on the net (sewn on delicately). Sometimes these were needle-point and sometimes bobbin-made (pillow). Great ingenuity, variety and skill were displayed in the fillings between these ornaments. Ghent and Alost, as well as Brussels, derived great profit from this kind of lace.

Point-plat appliqué is the name given to bobbin-made sprigs applied to machine-made net. Point Duchesse is also a Brussels lace. It is a bobbin (or pillow) lace of fine quality in which the sprigs (resembling Honiton) are connected by *brides*. Duchesse is a modern name. The lace resembles the old tape-guipure of Flanders, made at Bruges in the 17th and 18th centuries and much used for cravats.

Mechlin.—Mechlin lace is ranked very high by connoisseurs. It is also called *Point de Malines*. Mechlin is made in one piece on a pillow with bobbins, the ground and the pattern being worked together with various fancy stitches. Its distinguishing feature is the *cordonet*, here a flat, silky thread which outlines the pattern and gives this lace almost the character of embroidery. The hexagonal mesh of the *réseau* is made of two threads twisted twice on four sides and four threads plaited three times on the other two sides. Sometimes the pattern is "*fond de neige*," sometimes "*oeil de perdrix*" and sometimes *Fond Chant*. Very early Mechlin has *points d'Esprit* (little square dots); but this is rare. The characteristic pattern is a sort of sunflower, rose, or pink, in full blossom and also with closing petals. The border is a shallow scallop, or it is slightly waved. The flower appears on the edge and the rest of the ground is sprinkled with square spots, quatrefoils, or leaflets. The flower is Flemish in character and the powderings (*semés*) are French in style. Open spaces, filled in with *brides*, that make a kind of lattice-work, are characteristic and give Mechlin a charming delicacy. A four-petaled flower often fills in

the spaces in the scrolls. Mechlin was always a costly lace. "It is without question," writes Lefébure, "the prettiest of all pillow-laces." Mechlin was in great request during the reign of Louis XV and the rococo style of ornament prevailed in its designs. To some extent, in their lightness and delicacy, they may be compared with similar patterns upon contemporary engraved glass from Saxony and Bohemia. Under Louis XVI, floral sprays and delicate interleavings were used in the patterns. No better lace can be found to assimilate with and adorn light textures, such as gauze and muslin. Our great-grandmothers showed appreciation of its appropriateness in using it to adorn their mountains of powdered hair. Mechlin was also made in Lierre, Turnhout and Antwerp.

Antwerp.—Antwerp was a great mart. Its distinctive lace had a vase, or pot of flowers, whence its name "*Potten Kant*." The blossoms are pinks, roses and sunflowers, and sometimes straggling branches are thrown from the flowers. The ground varies: sometimes it is the six-pointed star; sometimes the partridge eye, etc.

Lille, the old capital of Flanders, was not a French town until after the Treaty of Aix-la-Chapelle. Its lace resembles Mechlin. The chief difference is in the *réseau*, which is even lighter than that of Mechlin. It uses the *Fond Chant* (six-pointed star) and the "*fond simple*." Square dots, known as "*points d'esprit*," are also characteristic of Lille. The laces of Mons are also Flemish. Ypres, Alost, Courtrai and Bruges made lace of the Valenciennes type. Ghent, Binche, Liège and Saint Trond were also centres. In fact, for three centuries lace-making has been the chief industry of Flanders and of Belgium.

German Lace.—Germany claims the invention of lace. A tombstone in Annaberg reads: "Here lies Barbara Uttmann, died, 14 Jan 1575, whose invention of lace in 1561 made her the benefactress of the Harz Mountains." Barbara Uttmann, wife of a rich mining overseer, however, learned to make pillow-lace from a Brabant exile. She set up a workshop in Annaberg, which employed 30,000 workers. French refugees in northern Germany (most of them from Alençon) improved lace-making there and Italians influenced work in Bavaria and Saxony; but German lace never acquired artistic reputation outside of Germany.

English Lace.—England was never a great lace-making country; but the wealthy lords and ladies purchased lavishly of the fine laces of other countries. English flax was poor in comparison with that of the Continent, which may have been the reason that Point lace was little made. Tudor inventories mention the fine "cutworks" and "points" of Italy, and no one had more of them than Queen Elizabeth. She also patronized fine Flemish lace. In her reign Flemish refugees, flying from the persecutions of Alva and the "Spanish Fury," carried the lace-making industry to Devonshire. Honiton was their chief settlement, and from this time onward we read of "bone-lace" in old Elizabethan literature, a name, of course, for bobbins (sometimes made of bone). In the second half of the 17th century Flemish Point supplanted Venetian and French in the estimation of the English. When Cromwell's body lay in state it was draped with superb Flemish Point.

LACE

At the top is an example of Italian 18th century needlepoint in relief, Gros Point de Venise. Below are examples of Flemish 18th century bobbin.

The enormous demand for Flemish Point occasioned smuggling on such a vast scale that Parliament prohibited all importations of it. Then, to supply their customers, merchants bought lace in Belgium and smuggled it into England where they sold it under the name of *Point d'Angleterre*, or English Point; and under this name it often was taken to France and sold. This lace was Brussels Point. Flemish lace continued popular for a long time in England. Defoe makes Robinson Crusoe send from Lisbon "some Flanders lace of good value as a present to the wife and daughter of his partner in the Brazils."

Honiton Pillow.—The most famous English lace is Honiton. It resembles the old tape guipure of Flanders with open *brides*. The patterns are large and are made first and then joined. The "Honiton Sprigs" were (and still are) famous, although the poppy, butterfly, acorn, etc., have not always been of fine design. Honiton resembles in some degree the "Duchesse Point" of Brussels. It still keeps to the Flemish type. Its value was determined by covering a piece of lace with shillings. Queen Victoria's wedding-dress was of Honiton and cost £1,000 (\$5,000). Honiton lace-veils, worth hundreds of guineas, are treasured heirlooms in America and in England. England has had two centres of lace-making: Devonshire; and the South Midlands (Nottingham, Bedford and Buckingham). In the latter town lace was made after the style of Mechlin, Antwerp and Lille, always grounded and never guipure (as in Honiton). Machinery for making lace was invented in Nottingham. In 1768 a workman, Hammond, conceived the idea of making a net tissue on a stocking-knitting machine. This was improved by Heathcote's bobbin net loom in 1809. The French then established manufacturing in Lyons and Saint Pierre-des-Calais. In 1837 Jacquard invented his apparatus for fancy weaving; and an adoption of it to net-weaving machines produced tulle, *brochés*, or flowered nets. This gave a severe blow to hand-made lace. Buckingham and Nottingham have also been famous for their Yak lace, made from the wool of the Yak. The designs, following those of Malta and Genoa, are decorated with wheat-ears and resemble the ancient "cut-work."

Irish Lace.—Lace began to be an industry in Ireland in 1829-30 in Limerick and Carrickmacross. Limerick is a *tambour*, i.e., threads embroidered on net, and Carrickmacross is distinguished by patterns cut in cambric and applied on a net ground. Beautiful, ornate stitches like latticework are also characteristic of Carrickmacross. The style came from Italy. Vasari says it was invented by the painter Botticelli. Point lace, in the style of the 17th century, is now made at Youghal (County Cork), the chief centre, and also in Kenmare, Killarney, Waterford, Kinsale and New Ross. Linen thread of the finest kind is used and the meshes are so small that the stitches are almost invisible. Irish Point owes its existence to the failure of the potato crop in 1847. The Irish then tried to gain money by the Point Lace industry. It is a beautiful production and is worked entirely by the needle.

Peasants make pillow lace in every country, differing in style and pattern in every place. In

many countries Torchon is made. This is also called "beggars" lace. It has been imitated successfully by machinery. The knotted lace known as *Macramé*, made in convents in the Riviera, is taught by the nuns to the peasants. It is a survival of the old knotted lace made in Spain and Italy in the 15th and 16th centuries. It is tied with the fingers. *Macramé* is much used in Genoa. The name is Arabic in origin.

Of late years beautiful handmade lace has been produced in the United States in the newly established "lace-schools," particularly after Italian methods. Some of these schools are under wealthy patronage; others are connected with settlement work.

Lace is made in the Latin-American countries after the Spanish styles. In Fayal lace is fashioned out of the fibre of the aloe. In the Philippines lace is made from the fibre of the pineapple.

The machine-lace industry of Europe is centred in Paris, Lyons, Calais, Saint Gall, Nottingham and Plauen. The importations of laces and embroideries (including nets, veilings and curtains) in the calendar year 1926 were as follows: Handmade laces, \$982,607; machine-made laces, \$5,074,568; articles in part of lace, \$1,236,995; nets, veilings, etc., \$1,047,473.

Author of 'The Art of the Belgian Galleries';
'French and English Furniture,' etc.

LACE BARK, is derived from the inner bark of several species of trees and is readily detached in sheets or layers like birch bark, each layer being a delicate network of fibre, which when gently stretched a pentagonal or hexagonal mesh is formed which resembles lace. The most commonly known species is the lace bark tree of Jamaica, *Lagetta linearia*. It is said that Charles II was presented by the governor of Jamaica with a cravat, frill and pair of ruffles made from this substance. The fibre can also be twisted into strong ropes and in past time thongs and whips were made from it, with which the negroes were beaten. The lace bark tree of New Zealand is an Australian species, *Plagianthus betulinus*, more commonly known as the ribbon tree; its layers of bark showing the same beautiful lace-like texture as the Jamaica form. Another species producing a delicate, white lace-like tissue is the Birabira of South America, *Daphnopsis tenuifolia*.

LACE BUG, vulgar name for some of the *Tingitida*, given on account of the gauze-like or lace-like meshes of the wing covers, lacking membrane and almost transparent, widely expanded beyond the body. A hood-like process also filled with meshes, sometimes projects forward. The *Corythuca arcuata* is an example

of the group and is found in vast numbers on the undersides of leaves of oak trees. It lays its eggs next the midrib and veins and stays there drawing sap from midsummer until frost. It measures about a sixth of an inch. The *Corythuca ciliata* abounds on the sycamore. They are both white.

LACEAEMON, lās-ě-dě'mōn. See SPARTA.

LACEPEDE, lā-sā-pēd', COMTE DE (BERNARD GERMAIN ETIENNE DELAVILLE), French naturalist: b. Agen, France, Dec. 26, 1756; d. Epinay, France, Oct. 6 1825. He abandoned the military profession, for which he was destined, and devoted himself to the study of natural history. His teachers and friends, Georges Buffon and Louis Daubenton, procured him the important situation of keeper of the collections belonging to the department of natural history in the Jardin des Plantes. In 1791 he was elected member of the Legislative Assembly and belonged to the moderate party. Napoleon made Lacépède a member of the conservative Senate and conferred on him the dignity of grand chancellor of the Legion of Honor. After the restoration he was made peer of France. He continued Buffon's *Histoire naturelle* with the titles *Histoire des quadrupèdes ovipares et des serpents* (1788-89) and *Histoire naturelle des reptiles* (1789) and published also *Histoire naturelle des poissons* (1798-1803); and *Histoire des cétées* (1804).

LACERTILIA, lās-ēr-tīl'ī-ā, or **SAURIA**, sō'ri-ā, reptiles belonging to the suborder (of the order Squamata) that contains the lizards (q.v.).

Diagnostic Features.—Lizards, as representatives of the Squamata, are characterized by having a single temporal opening, the upper, which lies above the suture of the postorbital and squamosal reduced, and the quadratojugal absent. Flexibility of the jaws is provided by a movable quadrate. The tabular or the supratemporal is represented by a single bone, and the lacrimal is greatly reduced or absent, along with the postparietal.

In recent lizards the teeth are not set in sockets; they are fused to the crest (acrodont) or to the inner sides (pleurodont) of the jaw. The palate is similar to that of primitive reptiles.

Lizards differ from snakes (derived from lacertilian ancestors) in having the right and left halves of the lower jaw united by a suture, and usually in having the anterior end of the brain case open. Most lizards also differ in having movable eyelids, at least traces of a pectoral arch, and a parietal (pineal) eye. There are exceptions to these characteristics, but in combination they serve to differentiate the suborders. Lizards resemble snakes in having paired copulatory organs, and a transverse anal opening.

Origin.—The oldest lizard remains are found in rocks of the Jurassic period, some 150 million years old. Although there is no clear-cut evidence, it is probable that the Lacertilia represent a branch of the same stock, eosuchian in origin, that evolved the Rhynchocephalia. Hence their ancestry may date back to the late Permian period, roughly 200 million years. The rhynchocephalians disappear in the fossil record at approximately the same time that the adaptively similar lizards begin their expansion. It was not

until later, during Tertiary times, that lizards began to flourish. They gave rise to the snake at least as early as the Cretaceous, and probably earlier. Since the Cretaceous many lizards have lost limbs or undergone other modifications fitting them for subterranean habitats. To this extent many existing lizards are snakelike. Further evolution in the serpentine direction may have been precluded owing to the snakes' having pre-empted the modes of existence available to the sort of reptile. Some families of snakes, particularly the Typhlopidae, retain characteristic of burrowing lizards and fill similar roles in nature.

Classification.—The most recent survey of the Lacertilia is that of C. L. Camp (1923), with minor modifications by M. A. Smith (1932) and Alfred S. Romer (1945). Seven infraorders, comprising the following families are recognized:

Infraorder GEKKOTA. Lizards with six cervical vertebrae, a fleshy, protrusible tongue and an incomplete postorbital arch; pleurodont. Vertebrae either amphicoelous with persistent intercentra, or secondarily procoelous without intercentra.

1. Family GEKKONIDAE—Geckos. Bony temporal arch lacking, eyes usually covered with a transparent membrane without movable lids, the pupil often elliptical; osteoderms lacking. The families Uroplatidae and Eublepharidae recognized by some authors, but possibly derived phylogenetically from the Gekkonidae, are not retained by Smith (1933). Gecko (q.v.) inhabit the warmer portion of the world, with a few in temperate zones.

Infraorder IGUANIA. Lizards with six cervical vertebrae, complete skull arches; procoelous vertebrae, with no intercentra; a fleshy, scarcely protrusible tongue. Eye with movable lids and a round pupil.

1. Family IGUANIDAE—Iguanas. Pleurodont, teeth usually with cutting edges but with little specialization (homodont). Largely confined to the New World; representatives in Madagascar and Polynesia.

2. Family AGAMIDAE—"Dragon lizards." They differ but little from the iguanids except that the teeth are acrodont. Confined to Eurasia, Africa and Australia.

Infraorder RHINOLOSSA. Lizards with three cervical vertebrae, complete skull arches, and procoelous vertebrae with elongate centra.

1. Family CHAMELEONIDAE—Chameleons. Casque headed lizards, with an extremely extensible tongue, no clavicle or interclavicle, and with opposable digits in bundles of two or three. Largely confined to Africa and Madagascar; three species in Eurasia.

Infraorder SCINCOMORPHA. Lizards with moderately long, usually scaly tongues, with a slight distal bifurcation.

1. Family XANTUSIDAE—"Night lizards." Vertebrae procoelous; dorsal scales granular, ventrals squarish. Supratemporal fenestra closed by union of squamosal and parietal bones; pleurodont. Eyes with movable lids covered by a transparent membrane. Confined to southern North America and Cuba.

2. Family SCINCIDAE—Skinks. Vertebrae normally procoelous, skull arches complete, dentition pleurodont. Premaxillaries not fused, osteoderms present on head and body. Ventral scales imbricate, no femoral pores. Limb present or represented only by vestiges of pectoral and pelvic girdles.

3. Family ANELYTROPIDAE. A single limbless species differs from skinks in lacking skull arches or any trace of a pectoral arch; premaxilla single. Confined to eastern Mexico.

4. Family FREYLIIDAE. Limbless lizards probably derived from skink stock; vestiges of a pectoral girdle present, premaxilla single. Confined to Africa.

5. Family DIPSIDAE. Burrowing lizards with skull arches, and united premaxillaries. Derivatives of the skink stock, with no forelimbs, hind limbs absent in the female, but represented by external vestiges in the male. Osteoderms lacking. Three species, in Indochina, the Philippines, the Malay Peninsula, and adjacent islands.

6. Family GERRHOSAURIDAE. Supratemporal fossa roofed over by osteoderms, also present on body. Ventrals scales non-imbricate; femoral pores present. Confined to Africa and Madagascar.

7. Family LACERTIDAE. Supratemporal fossa roofed over by osteoderms, absent on the body. Abundant in Africa, represented in Europe and Asia.

8. Family TEIIDAE. Lizards with the supratemporal fossa open, no osteoderms. Confined to the Americas.

9. Family ARDEOSAUROIDAE. Fossils from the Upper Jurassic of Europe are placed in this family, possibly related to the gekkos.

Infraorder AMPHISBAENIA. Burrowing limbless lizards, with vertebrae having broad, flat centra.

1. Family **AMPHISBAENIDAE**—"Worm lizards." No skull arches, no osteoderms, premaxilla single. Except for two species in western Mexico that retain forelimbs, the pectoral arch is vestigial or absent. Largely restricted to Africa and South America, one species in Europe, one in Florida, a few in the West Indies, and western Mexico. Infraorder **PLATYNOTA**. Lizards with long, slender bifid, retractile tongues.

2. Family **VARANIDAE**—the monitors. Seven cervical vertebrae; pleurodont; head covered with small scales. A single genus with living representatives, often of large size, in Africa, Asia, the East Indies and Australia. Other genera are known from fossils in North America, Eurasia and Australia.

3. Family **DOLICHOSAURIDAE**. Ancient relatives of the Varanidae, from Cretaceous deposits in Europe.

4. Family **IGUALOSAURIDAE**. Primitive marine lizards with seven cervical vertebrae and sub-theodont (partly socketed) teeth. The Lower Cretaceous of Europe.

5. Family **MOSASAURIDAE**. Marine lizards, some, 30 feet long, with paddlelike limbs; seven cervical vertebrae; sub-theodont teeth. Widely distributed during Upper Cretaceous times.

Infraorder **ANGUIMORPHA**. Lizards with normally procoelous vertebrae; six cervicals; osteoderms sometimes present.

1. Family **PYGODIDAE**. Slender, snake-like lizards, with no forelimbs, vestiges of hind limbs, a feebly bifid, extensible tongue, small eyes, pupil vertical, without movable lids. Skull arches lacking, pleurodont.

2. Family **ANGUIDAE**. Skull arches lacking; pleurodont; six bones in mandible; entire body protected by osteoderms. Limbs fully formed, vestigial, or absent. Widely distributed, but absent from Australia. The family Euposauridae of the Upper Jurassic of Europe may be related to the Anguidae.

3. Family **ANNIELLIDAE**. Limbless lizards, without skull arches; five bones in the mandible; osteoderms present; pleurodont. Restricted to California, Lower California, and one adjacent island.

4. Family **XENOSAURIDAE**. Skull arches, osteoderms present; pleurodont; five bones in the mandible. Southern Mexico and Guatemala.

5. Family **HELODERMATIDAE**—Beaded lizards. Postorbital arch present; supratemporal arch absent. Pleurodont; teeth grooved in two surviving species (*Heloderma*, the only venomous lizards). Restricted to western Mexico and the American Southwest. Grooves lacking in teeth of the Bornean *Lanthanotus*, sometimes placed in the family Lanthanotidae. The one species in the family Shinisauridae of China may be related to *Lanthanotus*. The extinct family, Glyptosauridae, is intermediate between the Helodermatidae and the Anguidae.

6. Family **CORYLIDAE** (**ZONURIDAE**). Skull arches present, six bones in the mandible, pleurodont. Osteoderms usually present. Confined to Africa.

C. M. BOGERT,

Chairman and Curator, Department of Amphibians and Reptiles, American Museum of Natural History.

LACEWING, a neuropterous insect belonging to the families Hemerobiidae (brown lacewings) and Chrysopidae (green lacewings), of which more than 700 species are known. The chrysopids have golden eyes; the eggs are fas-

Lacewing fly

tened at the end of a long slender stalk and may be laid singly or in groups of twenty or more which may be in rows or in a concentric pattern. The hatching larvae usually eat part of the egg shell before crawling to the base of the stem and going in search of living food. They are

elongate, hairy, and characterized by a pair of long jaws through which they suck the juices of their victims.

Lacewings are called aphid lions and are extremely beneficial, living chiefly on aphids, scale insects, mites, eggs of other insects, and any small creatures they can capture. The hemerobiid eggs are not placed on stalks; the larvae have similar habits and are called aphid wolves.

LA CHAISE, François d'Aix de, là sház', French Jesuit confessor of Louis, XIV: b. Château d'Aix, Aug. 25, 1624; d. Paris, Jan. 20, 1709. He was the provincial of his order when Louis, on the death of his former confessor, appointed La Chaise to that office. The new confessor with admirable tact kept himself clear of the innumerable meshes of court intrigue. Jansenism was at the time a powerful factor in ecclesiastical and political circles, and the Jesuits were its most formidable adversaries, but La Chaise knew how to conduct himself under all circumstances with address, coolness, and sagacity; and never allowed himself to be drawn into violent measures against his opponents. That Louis XIV married Françoise d'Aubigné, Marquise de Maintenon, was owing principally to the counsels of his Jesuit confessor. La Chaise retained the favor of his monarch till his death, and Louis had a country house built for him to the west of Paris, on an eminence which had received the name of Mount Louis. Its extensive garden now forms the cemetery of Père Lachaise, the largest in Paris.

LACHES, là'kēs, Athenian general: d. 418 B.C. With Chareades he commanded a fleet sent to Sicily in 427 B.C. He was victorious but Cleon accused him of malversations. He participated in the battle of Delion (424), helped negotiate the Peace of Nicias (421), and was killed at Mantinea. In *The Wasps* Aristophanes satirizes Cleon's charges in the scene where a dog is tried for stealing a Sicilian cheese.

LACHES, làch'ēz, a legal term derived from the Old French *lachesse*, remissness, which in turn was derived from the Latin *laxus*, slack, unreasonable delay, neglect to do a thing or to seek to enforce a right at a proper time. Courts of equity withhold relief from those who have delayed the assertion of their claims for an unreasonable time. The questions of laches depends not upon the fact that a certain definite time has elapsed since the cause of action has accrued, but upon whether, under all the circumstances, the plaintiff is chargeable with want of due diligence in not instituting the proceeding sooner. To constitute laches to bar a suit there must be knowledge, actual or imputable, of the facts which should have prompted action or, if there were ignorance, it must be without just excuse. Laches may be excused from the obscurity of the transaction; by the pendency of a suit; and where the party labors under a legal disability, as insanity, but poverty is no excuse for laches, nor ignorance, and absence from country. Laches on the part of its officers cannot be imputed to the government and no period of delay on the part of the sovereign power will serve to bar its right either in a court of law or equity when it sees fit to enforce it for the public benefit.

LACHESIS, làk'ē-sīs, in classical mythology, one of the three Fates (q.v.).

LACHINE, city, Quebec, Canada, on Montreal Island in the county of Jacques Cartier, 8 miles southwest of Montreal. It is at the lower end of Lake St. Louis, an expansion of the St. Lawrence River below its confluence with the Ottawa and immediately above the Lachine rapids and canal. The importance of the city is industrial and suburban to Montreal, its manufactures employing about 8,000 and producing to the gross value of \$55½ million (1948). Bridge and other construction materials, tools, machinery and steel equipment, chemicals and rubber goods, are the principal products. Hydroelectric power is developed from the canal and the surplus disposed of in Montreal. Lachine commands the shipping of the upper St. Lawrence, all of which must pass through the canal, and is also on the main lines of the Canadian National and Canadian Pacific railways between Montreal and Toronto. It has 4 banks, French and English high schools, and French and English hospitals.

As an early outpost of Montreal it has an interesting history. The rapids from which it takes its name were so called in derision of La Salle who established a trading post on the spot in 1669 and was restlessly seeking a passage to China. In 1687 it was the scene of a terrible massacre of the French by a band of 1,500 Iroquois in which 250 settlers perished. During the 18th and early 19th century Lachine was the assembling point from which the brigades of the fur traders started on their long and adventurous journeys via the Ottawa into the upper Lakes and the far West. Pop. (1951) 27,773.

LACHINE CANAL. See CANADIAN CANALS.

LACHISH, lä'k'ish, Biblical locality, Palestine, in Judaeen Hills. It was destroyed by Joshua and given to the tribe of Judah, and was fortified by Rehoboam. King Amaziah sought refuge there but was slain. Sennacherib, in his campaign against Judah, captured this town and King Hezekiah sent a deputation there with presents to placate Sennacherib. Micah denounced the place as "the beginning of sin to the daughter of Zion," the intent of which is not clear. Its site is identified with Tell-el-Hesi, the hillock excavated by Sir Flinders Petrie and F. J. Bliss (1890-1893) for the Palestine Exploration Fund, some 16 miles east of Gaza.

Consult Flinders Petrie, W. M., *Tell-el-Hesi* and Bliss, F. J., *A Mound of Many Cities*, both published by the Palestine Exploration Fund in 1891 and 1894, respectively.

LACHLAN, läk'län, a river, New South Wales, having its source in the Cullarinrange, 175 miles southwest of Sydney. The river makes a semicircular sweep north of about 240 miles, when, pursuing a generally southwest course, it joins the Murrumbidgee, the united stream afterward falling into the Murray. The total course is about 800 miles.

LACHMANN, läk'män, **Karl Konrad Friedrich Wilhelm**, German scholar and classical philologist: b. Brunswick, March 4, 1793; d. March 13, 1851. As a student at Leipzig and Göttingen his work lay in Italian, English and Old German poetry, as well as in Greek and Latin. As a teacher he passed from various gymnasium positions to professorships in the universities of Königsberg and Berlin. His work

in textual criticism, both in the early German and the classics, was epoch-making. Editions of Walther von der Vogelweide, Wolfram von Eschenbach, Lucretius (his greatest achievement as an epoch-making work), Catullus, Tibullus Propertius, the New Testament and Shakespeare's sonnets and Macbeth deserve mention among his numerous publications.

LACHNER, läk'nēr, **Franz**, German orchestral composer: b. Rain, Bavaria, April 2, 1804; d. Munich, 1890. He studied music at Vienna and was appointed *Vizekapellmeister* (assistant conductor) at Kärntner Theatre (1826) and conductor (1927). In 1834 he went to Mannheim to conduct the opera and became court conductor there (1836), general music director at Munich (1852), retiring (1865) on a pension.

His works are prodigious in number, consisting of an oratorio, a sacred cantata, four operas, requiems, three grand masses, besides other cantatas, entr'actes, etc.

LACHUTE, lä-shōöt', mill town, Quebec, Canada, agricultural marketing center and seat of Argenteuil County, on the North River, 48 miles from Montreal by the Canadian Pacific railway. It has 11 industrial plants (saw, paper and veneer mills, textiles, machine and woodworking shops, etc.), producing to the value of \$2,169,421 (1948); 4,500 horsepower has been developed from the river. There are Protestant and Roman Catholic schools, an academy, 6 churches, a hospital, several hotels, and 4 banks. The town owns a gravity water system and is adjacent to picturesque Laurential Hill. Pop. (1951) 5,500.

LACINARIA, lä-sin-a'ri-a, a genus of plants of the thistle family containing about 30 species of tall perennial herbs growing in dry soil throughout the eastern and central United States and known as blazing-stars and button snake-roots. They bear late in the season dense spikes of purplish flowers, often in the south a foot in length and of a delicate lavender tint very effective when seen in a mass of goldenrod or autumnal grasses. *L. squarrosa* is known as colic-root, and all the species are in repute among the southern country folk, not only as good family medicine in the form of a decoction made from the root, but as a specific against rattlesnake venom.

LACKAWANNA, läk-ä-wön'ä, city, N. Y., in Erie County; altitude 607 feet; on the Baltimore and Ohio and the Lehigh Valley railroads; with water transportation via the New York State Barge Canal and Lake Erie; 9 miles south of Buffalo airport. This is an industrial city working in steel, cement, abrasives, and refractories. It has a Carnegie public library. The beautiful basilica of Our Lady of Victory is visited yearly by millions of Roman Catholics. The city received its charter in 1909; has mayor and council. Pop. (1950) 28,453.

LACKAWANNA RIVER, a considerable stream which rises in the northeast part of Pennsylvania and flows through the valley formed by the Shawnee and Moosie mountains, discharging into the Susquehanna at Pittston; length about 50 miles. Great quantities of the best anthracite coal are mined in the valleys adja-

cent to this river, the entire district being given over to collieries, rolling mills, blasting furnaces and factories, Scranton being the principal town. The greatest thickness of strata belonging to the coal measures amounts in the central portion of the basin to nearly 1,800 feet. On each side they dip toward the central axis at angles sometimes exceeding 30 degrees, gradually lessening till they are found in horizontal and undulating positions near the center.

LACLOS, là-klô', Pierre Ambroise Francois Choderlos de, French author: b. Amiens, Oct. 19, 1741; d. Tarent, Nov. 5, 1803. He was a captain of artillery and private secretary of the Duke of Orleans, becoming notorious through his obscene novel *Les liaisons dangereuses* (Amsterdam and Paris 1782). He was editor of *Journal des amis de la Constitution* (1791) and was made (1792) brigadier general. He got entangled in the Duke of Orleans case, but Robespierre spared him, and he became inspector general of the Army of Southern Italy.

LACMUS. See LITMUS.

LACOLLE MILL, Battle of, in the War of 1812. Shortly after Gen. Wade Hampton went into winter quarters following the Battle of Chateaugay, Gen. James Wilkinson went to Plattsburg and wrote a letter to the secretary of war demanding a review of his conduct by a court-martial. Pending a reply he determined to strike a blow at Montreal, the road to which was barred by small garrisons at St. John and Isle Aux Noix and by outposts at Lacadie and Lacolle. At Lacolle were 200 troops stationed in a stone mill with thick walls and solid front. On March 30, 1814 Wilkinson led 4,000 men and two 12-pound field guns against the mill. The gunfire inflicted no damage, whereupon, having received reinforcements from Isle Aux Noix, the British garrison made two sorties, but were repulsed, and the Americans continued their bombardment. As the British now numbered about 1,000 troops and as his losses amounted to 200 and little damage was being done by the guns, Wilkinson ordered a retreat and returned to Champlain. The British loss was 11 killed, 46 wounded and 4 missing. Wilkinson was then relieved of duty and Gen. George Izard (q.v.) took command.

LACON, là'kûn, city, Ill., and Marshall County seat, altitude 501 feet, on the Illinois River, the Gulf Mobile and Ohio Railroad, and a state highway; 30 miles north of Peoria and 128 miles southwest of Chicago. It stands at the head of navigation in the Illinois River, and has grain elevators and other shipping facilities. Its manufactures are woolen goods, cement blocks, and soft drinks. Government is administered by a mayor and council. It has public library facilities. Both the city and the county have jails at Lacon. Lacon is connected by a bridge to Sparland across the Illinois River. Pop. (1940) 1,627; (1950) 2,020.

LACONIA, là-kô'nî-à, the name for a large tract of land granted by royal patent to Ferdinand Gorges and John Mason in 1622. It was located between the Merrimac and Kennebec rivers, the ocean and the St. Lawrence River

of Canada. The present State of New Hampshire formed a considerable portion of Laconia.

LACONIA, a territory in ancient Greece. See SPARTA.

LACONIA, city, New Hampshire, and Belknap County seat, altitude 503 feet, on the Winnepesaukee River, the Boston and Maine Railroad, and state and federal highways; 27 miles north of Concord and 97 miles north of Boston. Its transportation facilities include a municipal airport. Among its manufactures are textile machinery, castings, skis and other sport goods, hosiery, needles, shoes, wood turnings (tees, handles, toys), wool products, and veneer board. The city is governed by a mayor and council. There are two public libraries: Gale Memorial, with a notable collection of Indian relics, and the Goss Reading Room.

Laconia has a radio station, a daily newspaper, a city hospital, and a state hospital for mentally retarded children. An interesting historical relic is Endicott Rock, a flat stone on which, in 1652, a party of surveyors carved the name of Governor Endicott.

Laconia was settled in 1761 by English people from southern New Hampshire, was incorporated as a town in 1855, and chartered as a city in 1893. On Lakes Winnepesaukee, Pausus, Winnisquam, and Opechee, Laconia, called "The City on the Lakes," is both a summer and a winter resort. Pop. (1940) 13,484; (1950) 14,745.

LACORDAIRE, là-kôr-dâr', Jean Baptiste Henri, French preacher: b. Recy-sur-Ource, March 12, 1802; d. Sorèze, Nov. 22, 1861. After studying law in Paris he began practice in that city. He was in religion a deist of the Voltairian school, and it was only after reading the *Essai sur l'Indifférence en Matière de Religion*, by Félicité Robert de Lamennais, a plea for Christianity as necessary for social progress, that he determined to become a priest. Entering the Seminary of St. Sulpice in 1824 he was ordained priest in 1827. In 1835 he was appointed preacher at Notre Dame, where his sermons attracted crowded congregations. He was, however, bent on a wider project, the revival of the Dominican order, the great order of preachers in France. With this view he revisited Rome in 1838, and after the usual novitiate became a Dominican. The Dominican is originally a Spanish order, and was never popular in France, and Lacordaire, who was appointed provincial of the order in 1850, had little success in establishing it there.

He was in 1848 elected a member of the National Assembly. He was, however, rebuked by his bishop for calling himself a Republican and retired from politics in 1852.

His honest indignation against the *coup d'état* expressed in a sermon roused the animosity of Napoleon III, and he was driven from the pulpit and became director of the Lycée at Sorèze. He was elected to the Academy in 1860. A collected edition of his works appeared at Paris in nine volumes in 1872.

LACOSTE, Sir Alexandre, Canadian jurist: b. Boucherville, Jan. 12, 1842; d. Montreal, Aug. 17, 1923. He was educated at the College Saint Hyacinthe and at Laval University and was called to the bar in 1863. He sat in the Legis-

lative Council of Quebec 1882-1884, became a Dominion senator in 1884 and chief justice of the Queen's Bench of Quebec 1891-1907. He was knighted in 1892.

LACQUER AND LACQUERWORK.

Lacquer or lackerwork is a process which originated in China but was brought to its greatest perfection in Japan. It is a species of natural varnish which, when applied to wood or metal, makes the surface impregnable to moisture, alcohol, or other damaging elements. The term comes from "lac," a resinous substance secreted by the *Tacchardia lacca*, a scale insect native to India, from which shellac is made. But the basic material of lacquer is vegetable rather than animal—the sap of a variety of sumac tree, the *Rhus verniciflua* (*R. vernicifera*, de Candolle) found in Japan, China, and in the Himalayas. The Japanese tap this tree (also called varnish tree and lacquertree) once in ten years, between June and September. They also tap the branches for sap from which they make a size called *Seshime-urushi*.

CHINA

A Chinese treatise of the Ming period states that lacquer was originally used for writing on bamboo slips, the earliest form of books. During the Chou dynasty, 1027-256 B.C., food utensils were made of black lacquer. A little later lacquer was employed for carriage decorations and leather trappings under official regulations. Remains have been found which show that in the earlier Han dynasty (202 B.C.-9 A.D.) pot covers were made of red lacquered paper. The Chinese made both painted and carved lacquer. In their decoration they used flowers and foliage, for the most part, highly conventionalized, as well as the four supernatural animals, the Dragon, Phoenix, Tortoise, and the Unicorn. The most plausible reason for the inferiority of Chinese lacquer to Japanese seems to be that the Chinese tap the lacquer tree at any time, while the Japanese do it when the sap is at its best. The development of the arts in which lacquer plays an important part in Japan, divides roughly into five periods.

JAPAN

Heian Period (784-1184 A.D.).—Lacquerwork developed into a fine art beginning with the establishment of the seat of the imperial government at Kyoto. It was used in the decoration of so important a building as the Hōōdō, and of the Byōdōin at Uji, a 9th century villa converted into a monastery by Fujiwara in 1053. Statues also were made of lacquer composition for a time but this was soon given up in favor of carved wood. Edicts were issued regulating the planting and registration of lacquer trees, the acceptance of lacquer as part payment of taxes, and the appointment of officials to superintend the industry. By 905, the dimensions and quantity of lacquer that could be used for a given object were specified.

Kamakura Period (1185-1333 A.D.).—With the victory of Yoritomo over the Taira at the Battle of Dan-No-Ura, a new government was set up at Kamakura. During this regime great strides were made in the technical processes, such as the use of inlay in gold, silver, and shell. Another process which was developed at this time was that of carved wood thickly lacquered in red or black which is called *Kamakurabori*. A third development of this period, to which the Japanese

themselves attach great importance was the manufacture of domestic utensils in polished black or red lacquer. This work was done exclusively by the monks of the Temple of Negori-ji Kii, and these articles were known as *Negori-nuri ware*.

Ashikaga Shogunate (1338-1573).—The overthrow of the Kamakura Shogunate, and the destruction of the town of Kamakura itself, gave way to a new regime under Ashikaga Takkanji who established his capital at Kyoto. Although a turbulent period in Japanese history, great strides were made in Japanese art. Lacquer decoration in relief (*takamakiye*) was developed and perfected. Shogun Yoshimasa in 1451 retired to Higashiyama, Kyoto, to devote himself to a life of luxury. He greatly encouraged the tea and incense ceremonies. Out of this several new forms of objects in lacquer developed, such as the date-shaped tea jar, or *natsume*. Rumors of the perfection of Japanese gold lacquer had by this time reached China, and Chinese artisans hastened to Japan ambitious to acquire the new technique.

Momoyama (1574-1602).—At the beginning of this period the civil wars broke up what we could call the lacquer guilds, and resulted in the formation of an independent school founded by Honami Kōetsu. This school specialized in simple but striking designs executed in high relief, and the use of large masses of metal or shell inlay. One writer suggests that this style took its inspiration from the illuminated sutras of the 12th century.

Tokugawa Shogunate (1603-1867).—Upon the death of Hideyoshi, power was seized by Tokugawa Shogun, Ieyasu. In 1637 Christianity was eliminated from the country and foreigners were barred. The history of Japanese lacquer from about 1600, resolves itself into the work of individual artists or families such as the famous Koma family whose founder Koma Kitō ye, was appointed Court Lacquerer to the Shogun Iemitsu in 1636, and whose successors held this appointment for eleven generations.

NEAR AND MIDDLE EAST

In the Near East lacquer was in general used merely as a varnish to protect painted surfaces as wall pannels or portraits and hunting scenes on small coffers, somewhat in the manner of Italian cassoni. One of the Egyptian caliphs, however, about 1131 built a belvedere near Cairo of lacquered wood and decorated with the portraits of his favorite poets. Lacquerwork was introduced into Persia from Cathay. Tamerlane, or Timur the Mongol conqueror, is said to have used lacquer work in the decoration of a palace which he built for one of his wives at Samarkand about the year 1400. During the 16th century, book bindings, pen boxes, and ink pots were beautifully decorated with hunting scenes, gardens, and flowers. But these uses of lacquer were comparatively rare and it was not until the decadent period of the 18th and 19th centuries that lacquerwork came into its own in the Near and Middle East. Nothing exceeded its popularity at this time but carpets. Every kind of object was painted and lacquered often with a mixture of European Biblical scenes and Persian erotica.

EUROPE

Tradition has it that European lacquer was invented and first used in Holland by the celebrated Christian Huygens or Huyghens (1629-

1695). However, before his epoch Oriental lacquer had been imported into Europe by Dutch traders. In 1605, Louise Coligny (1555-1620), dowager princess of Orange, who never neglected an opportunity to revisit France, brought from Holland, as a present to the dauphin, a Chinese panel, inlaid, gilded and painted, and decorated with Chinese fruits, flowers, and birds.

If the Dutch deserve credit for first inventing European lacquer, the French were not far behind them in developing its uses. In 1713, Dagly, a native of Spa, obtained a patent for the privilege of using certain lacquers, which he claimed to have invented, at the Gobelin factory. But the most famous of the European lacquerers were the Martin family of four brothers—Robert, Guillaume, Simon-Étienne, and Julien. They began by imitating Japanese pieces—works in relief in black lacquer decorated in gold. In 1733 Robert Martin (1706-1765) was made "Varnisher to the King." In 1744, there was an "*arrêt du Conseil*," which gave Simon-Étienne the exclusive right, for twenty years, to do all kinds of relief in the style of Japan and China. Their experiments in lacquer and varnish were so successful that they invented a varnish considered superior to the Japanese lacquer. The Royal Archives confirms this by listing in its inventory of furniture a secretary *vernissé de Martin* in the Japanese style with a design of flowers and foliage in gold on a red background. In the second half of the 18th century, there were three Martin factories in Paris, each supposedly presided over by one of the sons of Robert, one of whom took the title of "Varnisher to the King of Prussia," and was one of the group who decorated Frederick the Great's Sans Souci.

ENGLAND

Because of her interest in teapots and Chinese porcelains, Queen Mary, the consort of William III, has been credited with introducing the fad in England. While she may have made the style fashionable, it seems rather unlikely that she introduced it in England. Mary was not crowned until February of 1689, and the furnishing of Hampton Court was still in progress in 1695 when Celia Fienes made her tour through it. On the other hand, J. Stalker had published his *Treatise of Japanning* at Oxford in 1688. It seems hardly possible that Stalker would have felt justified in bringing out so imposing a treatise, the first in English, if there had not been an active interest in the subject. In his epistle to the reader he says "That Island [Japan] not being able to furnish these parts with work of this kind, the English and Frenchmen have endeavored to imitate them; that by these means the Nobility and Gentry might be completely furnished with whole sets of Japan-work, whereas otherwise they were forced to content themselves with perhaps a screen, a Dressing-box, or Drinking-bowl or some odd thing that had not a fellow to answer it." By 1692 the practice was well established, as in that year the *London Gazette* listed, "The places appointed for receiving Guns and Pistols . . . or other Ironwork to be Lacquer'd." In England, lacquerwork from the beginning was so popular with amateurs that by the middle of the 18th century it was dubbed "The Ladies Amusement." Pepys, in 1699 makes a note of a call on two ladies and adds, "They are also full of respect towards Mrs. Skynner and indeed have refined to the last degree upon her Book of

Japanning." Hampton Court had a complete room paneled in lacquer. Celia Fienes writes "one room was pretty large and at ye four corners were little rooms like closets or drawing rooms, one pannell'd all with jappan." Lacquered furniture was especially popular in England from about 1690 to 1730. It was made of deal or oak, often veneered, then ornamented, sized and finished with English varnish. Most of the English publications put out in the 18th century give recipes for making the varnish such as that in the *Ladies Amusement or the Art of Japanning Made Easy*. They advise spirits of wine as a base, "put some in a spoon and put a little Gunpowder in; and if it burns out, blows up the Gunpowder and leaves the spoon clean, then its a good spirit." The American publications were more conservative and did not come out until about 1800. One of these, published in Concord, gives a recipe for shellac varnish for japanning: "To one quart of the best alcohol, add half a pound of the thinnest and most transparent gum shellac, mix and shake together and let stand in a warm place for two or three days, then strain through a fine flannel."

Lacquered furniture was not brought direct to America from the Orient until the *Empress of China* made its round trip in 1784, the first American ship to enter the China trade. Articles in this ware had however been imported from England as the *New York Gazette* advertised in 1754: "Just imported a choice assortment of India, Japan gilded tea tables. . . Also tea tables with sets complete of cups and saucers in boxes for little Misses." The lacquer furniture made in America had a maple or pine wood base. They achieved their effect by painting the surface with paint, metal leaf and powder. Over this was painted the protective varnish made with a base of either spirits of wine or alcohol.

EDNA B. DONNELL,
Former Assistant Curator, Metropolitan Museum
of Art.

LACQUERS, Industrial.—Modern industrial lacquers are known for their brilliant durable coatings. They contain primarily a soluble cellulose compound, resins and plasticizers. These ingredients are dissolved in a mixture of volatile solvents and diluents (nonsolvents). Pyroxylin, cellulose acetate, ethyl cellulose, cellulose acetate butyrate, and cellulose acetate nitrate are the most commonly used tough film-forming ingredients. Plasticizers are incorporated to impart flexibility, and resins to give luster, adhesion, durability, and water-resistance. A careful balancing of the solvents and nonsolvents insures constant homogeneity during the rapid drying. In colored lacquers, pigments produce opacity and color and enhance the gloss. Stabilizers are also added to insure resistance to deterioration from light.

The term lacquer was formerly applied to any coating material which dried quickly to a finish resembling Oriental lacquers. Today, however, the word is used almost exclusively for the modern type of compositions described above.

The first cellulose derivative incorporated in lacquers was pyroxylin or cellulose nitrate (often incorrectly called nitrocellulose or nitrocotton). Alexander Parkes received a patent in 1852 for applying solutions of it to fabrics, but it was not until 1886 that such compositions were first manufactured in the United States by the F. Crane Chemical Co. The spraying of lacquers was developed in 1903. Nevertheless usage continued to be limited to thin coatings for silverware, brass fixtures, straw hats and novelties until the end of World War I because of the high viscosities of available solutions. Its use as an airplane dope during the war, however, led to many new developments including cheap solvents, new resins and low viscosity cellulose compounds. This resulted in a very extensive expansion of the manufacture of lacquers after the war in meeting a demand for rapid-drying industrial finishes. This growth still continues both in importance and volume.

The automobile and railroad industries employ lacquers for both exterior and interior finishes. The exterior coatings must naturally withstand the most severe treatment from both weather and usage. A careful selection of plasticizers and resins has made it possible to produce the necessary properties. Where the lacquers are used for the fabrics or wire wheels greater amounts of plasticizers are incorporated. Even felt-like finishes for interior accessories are obtained by spraying lacquers containing suspended fibers.

Another large field of use is refrigerator lacquers. Films of these must remain perfectly white, withstand low temperatures and resist all types of deterioration. Here, stoving is essential to develop the required firm characteristics.

The furniture industry has also greatly saved time and labor by the use of these materials. Clear lacquers are employed where the natural effects of metal or wood are desired, but large quantities of pigmented lacquers (lacquer enamels) are used on office furniture. These finishes must have good adhesion and not soften under hot dishes or pressure. Asphalt or chlorinated rubber are added to the compositions when the furniture is to be exposed to chemicals as in laboratories. Much heavier films are applied during a single spraying than in other industries.

The leather and textile industries employ a wide variety of lacquer compositions to meet their many needs. Here, large proportions of processed oils, such as blown castor oil, are added to the lacquer to obtain the desired flexibility, while only limited quantities of resins are needed for adhesion. In the manufacture of imitation leather or leather cloth, the coatings are applied by knife to a stretched fabric. Many other fabrics are also finished or dressed with lacquers to improve their appearance, strength and weight. Resistance to moisture, soiling and creasing, and protection of tinsel decorations against tarnishing are obtained in this way. Some colored goods are printed with lacquer enamels.

Another growing field of use is that of packaging where lacquers are employed for imparting moisture resistance to cellophane, cardboard and paper. Cheap transparent, heat-sealing packages are made in this manner for preserving foods. Special nontoxic, alkali- and grease-resistant wrappers for medicines, soap and similar products are produced with ethyl cellulose lacquers. Special lacquers which can be easily removed by

peeling are applied to metal articles to prevent corrosion during storage and shipment.

Ethyl cellulose lacquers were used during World War II as coatings for aircraft, raincoat guncovers and identification markers because of their marked resistance to extremes and sudden changes in temperatures. Besides these, they were used for fluorescent blackout coatings.

Lacquers are also employed in the manufacture of plastic wood, various cements, foils, transfers, high tension ignition cables, high-speed ink and as bronzing vehicles. Special products are now available for coating organic plastics. Realistic three-dimensional effects are obtained by decorating recessed designs cut into the reverse side of transparent moldings.

Crackled or marbled effects and crystallized patterns are also produced for various applications. The crackled coating is obtained by applying a lacquer of one color which contracts and cracks during drying over a smooth finish of another color. Crystallized effects are produced by dissolving substances such as naphthalene in the lacquer so that they will form large crystal line designs within the film as it dries. Lacquer with a minimum amount of solvent are now manufactured for spraying at elevated temperatures up to 70°F. This reduces solvent losses and some of the attendant hazards of spraying. Gel products which liquefy upon warming are made for applying thick films by dipping to wooden handles of tools and the like.

WILLIAM HOWLETT GARDNER.

LACRETELLE, là-krê-tèl', Jacques de French novelist: b. Cormatin (Saône-et-Loire) July 14, 1888. A realist and noted for his psychological novels, especially *Silbermann* (1922) and *La Bonifas* (1925), in 1932-1935 he published a tetralogy *Les Hauts-Ponts* based on a woman's passionate attachment to her family estate. Member of the French Academy, 1938.

LACRETELLE, Jean Charles Dominique de, called **LACRETELLE LE JEUNE**, French historian and journalist: b. Metz, Sept. 3, 1766; d. Mâcon Mar. 26, 1855. The brother of Pierre Louis de Lacretelle (q.v.), he was for a short time a lawyer at Nancy, then went to Paris where, in 1790, he joined the staff of the *Journal des Débats* subsequently becoming secretary to the duc de La Rochefoucauld-Liancourt. A leader of the young royalists of the last days of the Convention and under the Directory, for whom the epithet *Jeunesse dorée* was coined, Lacretelle was forced to go into hiding after the 13th Vendémiaire. Arrested and imprisoned, after the 18th Brumaire he was freed by Fouché. Thereafter he devoted himself to writing. Elected a member of the Académie française in 1811, the following year he became professor of history in the faculty of letters of Paris. He welcomed the restoration of the monarchy in 1814, was rewarded with the title of royal censor and in 1822 with a patent of nobility. However, in 1827 he was the prime mover of the Academy's protest against the press censorship act and lost his official post. In 1848 he retired to Mâcon. Among his historical works are *Histoire de France pendant le XVIIIe siècle*

(1795); *Précis historique de la Révolution française* (1801–1806); *Histoire du Consulat et de l'Empire* (1846).

LACRETELLE, Pierre Louis de, French juriconsult and publicist: b. Metz, Oct. 9, 1751; d. Paris, Sept. 5, 1824. The son of a lawyer attached to the Parliament of Nancy, he became a member of the bar of that city in 1777. The following year he went to Paris where he collaborated with a fellow-Lorrainer, J. N. Guyot, on the latter's *Répertoire universel et raisonné de jurisprudence civile, criminelle, canonique et bénéficiale* (1775–1786). A member of the Commune of Paris, deputy to the States General, and member of the Legislative, he defended the Constitution of 1791. During the Directory he held high offices but was out of public life during the Empire. With Benjamin Constant and others he helped to edit the short-lived *Minerve Française* (1818–1820). His works include *Discours sur la multiplicité des lois* (1778) and *Du système de gouvernement* (1797).

LACROIX, là-kraw, Paul (pseudonym PIERRE DUFOUR and BIBLIOPHILE JACOB), French historian and novelist: b. Paris, Feb. 27, 1806; d. there, Oct. 16, 1884. He wrote under the nom de plume P. L. JACOB, BIBLIOPHILE, and is best known under that name. He was a prolific writer. His novels are on romantic history subjects. He edited (from 1829) in collaboration with Pichot *Mercur du XIX^e siècle* and founded (1830) *Gastronome* and *Garde national*. In cultural art he published a series of richly illustrated works, among them *Costumes historiques de la France*, 10 vols. (1852); *Le Moyen Age et la Renaissance*, 5 vols. (1847–1852); *Mœurs, Usages et Coutumes au moyen Age et à la Renaissance* (1871); *Vie Militaire et Vie Religieuse au Moyen Age* (1872); *Mœurs et Usages* (1883).

LACROIX, Sylvestre François, French mathematician: b. Paris, 1765; d. there, May 25, 1843. He was (1787) instructor at the Paris Military School, became (1788) professor at the artillery school at Besançon and examiner (1793) of artillery officers. In 1794 he was appointed chief of the Bureau of Committee for the Restoration of Public Instruction, and professor of mathematics at the Ecole Normale. He was appointed (1799) professor of the Polytechnic School and then professor of mathematics at the university, and in the same capacity (1815) at the Collège de France. He resigned from most vocations in 1821.

He wrote many books of instruction, also *Traité du Calcul Différentiel et du Calcul Intégral*, 3 vols. (Paris 1799); *Traité des Différences et des Séries* (1800); *Traité Élémentaire du Calcul des Probabilités* (1816); *Cours des Mathématiques* (1797–1816). These books were translated into German because of their clear style.

LACTANTIUS FIRMIANUS, lăk-tăn'shî-ŭs fŭr-mi-ă'nŭs, often called the Christian Cicero, on account of his pure Latin style, lived in the last half of the 3d century and at the beginning of the 4th. Constantine the Great made him tutor of his son Crispus. His most important work is the *Disinarum Institutionum Libri Septem*, a manual of Christian doctrine written to defend the religion to which he had been converted.

His works appear in Jacques Migne's *Patrologia Cursus Completus*, and have also been edited by G. Laubmann and S. Brandt (Vienna 1891).

LACTARENE, or **LACTARINE**, lăk'tă-rĕn, the casein of milk as commercially prepared by being freed from fat, precipitated by an acid, thoroughly purified, dried and powdered. It is insoluble in water, but is soluble in an alkali, such as ammonia, and in this form is used, like albumen, for fixing pigment colors in calico-printing. The cloth, after it has been printed, is steamed, the ammonia is driven off and the pigment is thereafter able to resist the action of water.

LACTASE, a soluble enzyme found in the animal body which hydrolyzes lactose to dextrose and galactose.

LACTATION. See MILK, HUMAN.

LACTEALS, lăk'tĕ-ălz, vessels which, together with the lymphatics, constitute one system for conveying a fluid or fluids from various organs of the body to the veins near their terminations in the heart. The fluid which the lacteals convey is milky after a full meal, and is called chyle, though during intervals of fasting it is a yellowish lymph, as in the lymphatics. The lacteal vessels commence on the intestinal villi, unite with one another in the mesentery and, after leaving the mesenteric glands, discharge their contents for the nourishment of the body into the receptaculum chyli, in front of the second lumbar vertebra. See also LYMPH; LYMPHATIC GLANDS.

LACTIC ACID (C₃H₅O₃). Karl Wilhelm Scheele, in 1780, was the first to describe the acid present in sour milk. In 1832 Justus von Liebig and Eilhardt Mitscherlich showed it to be a distinct acid. Lactic acid is widely distributed in nature, occurring in the sap of several plant families, in sour milk, in the saliva, blood and urine, and the brain and gastric juice of animals. Lactic acid is a result of the fermentation of the various sugars, and of dextrin and mannitol. There are many modes of preparing it artificially; and its isomeric varieties, of which four have been described, have excited much attention. Its two principal kinds are fermentation lactic acid and paralactic or sarcolactic acid. The former is got from concentrated sour whey by removing the curd, adding lime, filtering, diluting with water, removing the lime with oxalic acid, evaporating and extracting the lactic acid with alcohol. It is more usual, however, to get it by what is called the lactic fermentation, from sugar or saccharine substances. The sugar is dissolved in water; to the solution is added sour milk or decaying cheese and a quantity of fine, well-washed prepared chalk, and the mixture is kept for about four weeks at between 86° and 95° F. Fermentation ensues and much lactic acid is formed, which combines with the chalk and forms lactate of calcium. This salt is then decomposed by sulphuric acid, filtered, and the fluid is boiled with carbonate of zinc. Lactate of zinc is formed, which is collected and decomposed by sulphureted hydrogen. The fluid filtered from the sulphide of zinc is evaporated, and the sirupy fluid which remains contains the lactic acid. Lactic acid of commerce is a sirup (specific gravity, 1.215) which contains a small percentage of water. It remains liquid even at very low temperatures. It

deliquesces in moist air, dissolves in all proportions in alcohol and water, has no odor and has a purely sour taste. It cannot be distilled, or even heated, without undergoing decomposition, lactic anhydride or lactolactic acid being formed; at a higher temperature carbonic oxide is evolved, and a variety of products distil over, and charcoal is left in the retort. By oxidizing agents, such as bleaching-powder and nitric acid, it is converted into oxalic acid; by oxide of manganese into aldehyde.

The paralactic or sarcolactic acid was observed in flesh by Berzelius in 1806, and he considered it the same as that derived from milk. Liebig showed that they were not absolutely identical, but the nature of their differences is at present unknown. This acid is readily got from the cold aqueous extract of meat by adding a solution of baryta, coagulating and removing albumen, concentrating the solution, precipitating the baryta, filtering and evaporating. The syrupy residue contains the acid. Paralactic acid can be distinguished from lactic acid by its property of rotating the plane of polarization to the right, lactic acid being inactive. The calcium salt of the fermentation acid contains more water of crystallization; when heated it retains it for a shorter time; and it is more soluble than the sarcolactate. Again, the zymolactate of zinc contains more water, loses it more quickly on heating, but itself endures a much higher temperature without decomposition than the sarcolactate. The zymolactate is much less soluble in water and in alcohol than the other; the crystalline forms of the two salts also are different. The other salts of lactic acid are for the most part crystalline, and soluble in water. Lactic acid forms compound ethers and substitution acids.

In the arts, lactic acid is used in the dyeing of wool when mordanting with potassium dichromate, supplanting tartaric and oxalic acids. It is less corrosive, and imparts a finer feel and lustre. With an equal part of potassium lactate it forms lactolin, regarded as superior to the plain acid. Lactic acid is a solvent for several dyestuffs which are insoluble in water, and is of special use in the dyeing and printing of cotton textiles. It is also used in the tanning industry, in coloring, bating and plumping the skins, to which it imparts a fine grain. In the distilling industry it is used to check the development of deleterious bacteria.

In *medicine*, lactic acid is used in laryngeal tuberculosis, and diluted with six parts of water, it is applied locally in diphtheria and croup to dissolve the false membrane. It is also used as a local application in tuberculous ulcers, lupus and epithelioma.

LACTIC FERMENT, a minute organism which, under the microscope, is seen to consist of small elliptical cells, generally detached, but sometimes occurring in chains of two or three. It is developed in milk when it is allowed to stand for some time, and is the cause of the milk becoming sour, the sugar of the milk into lactic acid. It is also developed when cheese is added to a solution of sugar, and kept at a temperature of 35° to 40°. See also **FERMENTATION**; **LACTIC ACID**.

LACTOMETER, or **GALACTOMETER**, an instrument for ascertaining the different

qualities of milk. Several instruments of this sort have been invented. One consists of a glass tube one foot long, graduated into 100 parts. New milk is filled into it and allowed to stand until the cream has fully separated when its relative quantity is shown by the number of parts in the 100 which it occupies. Another is a specially constructed hydrometer used to determine the specific gravity of milk for the purpose of detecting adulteration with water. It has been learned by experience that the specific gravity of the milk of healthy cows does not fall below 1.029. See **ADULTERATION—MILK**.

LACTOSE, sugar of milk ($C_{12}H_{22}O_{11}$), a substance obtained by evaporating whey, filtering through animal charcoal and crystallizing. It forms hard, white, semi-transparent trimetric crystals, which have a slightly sweet taste, and grate between the teeth. It is convertible like starch into glucose by boiling with very dilute sulphuric acid.

LACTUCARIUM, the brown viscid juice of the common garden lettuce, obtained by incision from the leaves and flowering stems, and dried in the air. It is a mixture of various substances, including lactucine, lactucin, lactucic acid, mannite, albumin, etc. Lactucarium is hypnotic, anti-spasmodic and sedative, and has been recommended in cases in which opium is inadmissible, particularly for children. It has been administered with advantage in chronic rheumatism, diarrhoea and asthma, in doses of two to five grains.

LACUNAR, la'kū'nār, the Latin word defines a wainscoted and gilded ceiling, a panel-ceiling, and obtains its intent from the *sunken spaces* (coffers) of the paneling. It applies in architecture also to the under surface of the member of an order, the under side of the larmier or corona of a cornice, etc.

LACUSTRINE DEPOSITS, sediments laid down in lakes. They may be gravels consolidated into conglomerates, sands into sandstones, clays into shales, or marls into limestones. See **LAKES**, section on *Lakes* in article on **GEOLOGY**, and section on *Sedimentary Rocks* in article on **ROCKS**.

LADAKH, la'dāk', India, a province of Kashmir including the valley of the upper Indus and its tributaries. It is located between the Himalayas and Karakorum and has a climate ranging from fierce heat in the day time to icy nights. Vegetation is hindered by the dryness of the atmosphere, grain and fruit growing being restricted to the sheltered valleys and then only in stunted growths; and forests are few. The area is about 8,000 square miles, all at a great elevation, from 9,000 to 14,000 feet. A number of salt lakes furnish an endless supply of borax. Its game consists of wild horses, ibex, wild sheep, hares, etc. Goats supply a short wool which is used in the production of shawls. The inhabitants, 186,656, approximately, are small, unclean Turanians, strong of body and for the most part agriculturists. They are Buddhists and each village has its monastery. Except by the wealthy, polyandry is the rule. Commerce consists chiefly of the passage through from China of wool, tea, gold dust, silver, Indian cotton, skins, leather, grain, fire-arms, etc.; but native wool.

borax, sulphur and dried fruit are exported. Consult Cunningham, 'Ladakh, physical, statistical and historical' (London 1854); De Bourbel, 'Routes in Jammu et Kashmir' (Calcutta 1897); Adair, 'Sport and Travel in Baltistan and Ladakh' (London 1899); Younghusband, 'Kashmir' (London 1911); Neve, 'Thirty Years in Kashmir' (New York 1913).

LADARIO, la'da-ryō, an arsenal and small town in Matto Grosso, Brazil, about five miles east-southeast of Corumbá on the Paraguay River; one of the three arsenals of the Brazilian navy. See BRAZIL — NAVY.

LADD, George Trumbull, American educator: b. Painesville, Ohio, 19 Jan. 1842; d. 8 Aug. 1921. The Ladds, originally of Norman French extraction, intermarried with the Welsh family of Williams and the name appears in English history as early as the 13th century. Dr. Ladd was a lineal descendant, through the paternal line, of Elder William Brewster and Gov. William Bradford. He was graduated at Western Reserve University, A.B., in 1864; A.M., in 1867; and his honorary degrees were D.D. (1879), LL.D. (1895), Andover Theological Seminary; A.M., Yale (1881); LL.D., Princeton (1896). After graduation at Western Reserve University he spent two years in business, and then entered Andover Theological Seminary, whence he graduated in 1869. In 1869-71 he preached in Edinburg, Ohio, and in 1871-79 he was pastor of Spring Street Congregational Church, Milwaukee, Wis. In 1879 he was called to the chair of philosophy at Bowdoin College, and held that position until he became professor of philosophy at Yale College in 1881. After the death of President Porter (1892) he was made Clarke professor of metaphysics and moral philosophy, which position he held until 1906, when he resigned. His services to the cause of education carried him, at various times, beyond Yale. During the academic year 1895-96 he was chosen a member of the faculty of Harvard University and conducted the graduate seminary in ethics, and in 1906-07 he was substitute professor in Western Reserve University; thereafter, much of his time was spent in lecturing and travel upon important educational missions in foreign lands. Twice he was invited by the Imperial Educational Society of Japan to deliver courses of lectures, and in the summer of 1892 and again in 1899 he visited and lectured at Doshisha, Kyoto, Tokio, Hakone and Kobe. In this period Professor Ladd for 16 months delivered courses in the Imperial Universities of Tokio and Kyoto, and in Count Okuma's and other private universities, and in the government business colleges where he spoke on "Commercial Ethics," and made many other public addresses. His lectures on "Commercial Ethics" were later adopted as a textbook, and his other writings have been adopted as textbooks in Russia and other countries, as well as in Japan and India. In the spring of 1907 he went to Korea as guest and "unofficial adviser" of Marquis Ito, returning to the United States by way of Honolulu, where a month was spent in lecturing to teachers. For his services to the cause of education in Japan he was thrice admitted into audience with the emperor, the last in private when he was invested with the third degree of the order of

the Rising Sun. He was elected Gold Medalist of the Imperial Educational Society, and on the occasion of his third and last visit received the second degree of the order of the Rising Sun at the hands of the emperor.

In 1899-1900 he lectured on philosophy before the University of Bombay, India, and on the philosophy of religion at Calcutta, Madras, Benares and elsewhere. The lectures in Convocation Hall, Bombay University, were unique, inasmuch as no one before that time had lectured under its auspices, which honor was, in part, an official justification of the substitution of Professor Ladd's books for those of Herbert Spencer as required reading for the M.A. degree. His visits to Japan, and especially to Korea in the critical time of the readjustment of the political and social relations of the two countries, constitute an important factor in their history.

His contributions to the science of psychology and philosophy are widely known. He was one of the founders of the American Psychological Association, was its second president and its delegate to the International Congress at Paris in 1910. Among the most permanent of his achievements is the founding of the psychological laboratory at Yale, which, under his guidance, became one of the best equipped in the world. Up to the time of his resignation in 1906 there proceeded from Yale a continuous stream of teachers of philosophy, whose success has been largely due to the teaching and influence of Professor Ladd.

His position in American philosophy is sufficiently indicated by the appended list of his works. By some critics he has been erroneously called a disciple of Lotze and Porter, a theological apologist and defender of the traditional views, none of which appraisements is supported by the facts of his mental development. The fact is Ladd never studied with either Lotze or Porter, or became acquainted with their works until he had been a student of philosophy for 20 years. For many years he devoted himself to his great work, 'The Doctrine of Sacred Scripture,' from which, when completed, he turned exclusively to the problems of philosophy; but at no time was he anybody's disciple, or adopted any system, still less did he found any "school." His freedom from scholastic bias, combined with sagacity of judgment and catholicity of taste, accompanied by great patience and capacity for hard work, which were the strongest marked elements of his personality and temperament, scarcely warrant his being called a "dogmatist," but rather a "critical realist," or "radical rationalist."

Professor Ladd's published works include volumes on technical theology, psychology, philosophy and education. Besides these works he wrote extensively on his travels in Japan, Korea and India, and on questions connected with politics and the Great War, upon social criticism and practical ethics. He was also a frequent contributor to the technical journals, whose indices will serve as guides. His more important publications are 'Principles of Church Polity' (1882); 'Doctrine of Sacred Scripture' (1884); 'Outlines of Philosophy' (trans. of Lotze, 5 vols., 1887); 'Elements of Physiological Psychology' (1887, revised with R. S. Woodworth 1914);

What is the Bible? (1888); *Introduction to Philosophy* (1889); *Outlines of Physiological Psychology* (1890); *Philosophy of Mind* (1891); *Primer of Psychology* (1894); *Psychology Descriptive and Explanatory* (1894); *Philosophy of Knowledge* (1897); *Outlines of Descriptive Psychology* (1898); *Essays on the Higher Education* (1899); *Lectures to Teachers on Educational Psychology* (in Japanese); *Philosophy of Conduct* (1902); *What Can I Know? What ought I to Do? What Should I Believe?* (1914-1915).

LADD, William, American advocate of international peace: b. Exeter, N. H., May 10, 1778; d. Portsmouth, N. H., April 9, 1841. He was the son of a wealthy sea captain and after graduating from Harvard College (1797) he followed his father's profession, taking command of a large brig from Portsmouth. He was briefly involved in a free-labor experiment in Florida as a prospective means of abolishing slavery, but lost much of his fortune, and after 1812 settled on a farm in Maine. In 1819 he began to give his services to the cause of international peace; he founded the American Peace Society in 1828 and devoted his life to its growth and to the dissemination of its message through the formation of new groups, through its periodical which he edited, and through his other publications (*A Brief Illustration of the Principles of War and Peace*, 1831, and others). In order to bring his message more effectively into the Christian community he became a Congregational minister in 1837, the same year he enunciated his stand against defensive as well as offensive war.

Not content with a merely negative opposition to war, Ladd proposed an international organization to prevent it, the prototype of the Hague Court, the League of Nations, and the United Nations. His idea, as expressed in *An Essay on a Congress of Nations* (1840), was not original, but it offered the advantage over his predecessor's projects (notably that of Jeremy Bentham) of being concrete and practical, and its division of the international body into two institutions, a congress and a court, was a major contribution to the theory of international organization.

LADD-FRANKLIN, Christine, American psychologist and logician: b. Windsor, Conn., Dec. 1, 1847; d. New York, N. Y., March 5, 1930. A graduate of Vassar College in 1869, Christine Ladd studied logic at Johns Hopkins under Charles Sanders Peirce. After her marriage to the mathematician Fabian Franklin (1882), she worked on an original color theory, based on her studies with G. E. Müller in Göttingen and H. L. Helmholtz in Berlin, and later published in her book, *Colour and Colour Theories* (1929). She also lectured on logic and psychology at Columbia University (1914-1927).

LADEGAST, lä'dë-gäst, Friedrich, German organ builder: b. Hochhermsdorf, Germany, Aug. 30, 1818; d. Weissenfels, June 30, 1905. He is best known for his reconstruction of the organ in Merseburg (1855) and the building of the Leipzig Nikolaikirche organ (1859-1862).

LADENBURG, lä'dën-böörk, Albert, German chemist: b. Mannheim, Germany, July 2, 1842; d. Breslau, Aug. 15, 1911. He studied at Heidelberg, Berlin, Ghent, and Paris; and became instructor (1868) at Heidelberg, adjunct professor

(1872), and professor at Kiel (1873), and then (1889) at Breslau. He did useful work on the synthesis of alkaloids and the constitution of benzol. He conducted experiments with Charles Friedel and the two are credited with founding organic silicon chemistry.

LADISLAS, läd'is-läs; -läs, or LADISLAUS, -lôs, name of a number of kings who ruled in Bohemia, Hungary, Naples, and Poland.

BOHEMIA

LADISLAS I (Bohem. VLADISLAV). See **LADISLAS (LÁSZLÓ) V or VI**, called **LADISLAS POSTHUMUS of Hungary**.

LADISLAS (VLADISLAV) II (Pol. WŁADYSŁAW): b. March 1, 1456; d. Buda (now Budapest), Hungary, March 13, 1516. A member of the Jagellonian family, he was the son of Casimir IV, king of Poland, who attempted to secure the Bohemian and Hungarian thrones for his son after the death of Ladislas Posthumus. Ladislas' election, however, did not occur until after the death of George of Poděbrad (1471), and his rule in Bohemia (1471-1516) was contested by the Hungarian king, Matthias Corvinus—who had been proclaimed king of Bohemia in 1469 by a Bohemian minority—until the latter's death in 1490. Thereafter he also ruled Hungary as Uladislas II. Undistinguished as a statesman, he was dominated by the Bohemian nobility, and his attitude was always conciliatory in political or religious controversies.

HUNGARY

LADISLAS I (Hung. LÁSZLÓ, läs'lö), called **THE SAINT**: b. Poland, c.1040; d. Nitra, Hungary, July 29, 1095. He was the son of the exiled prince Béla, with whom he returned to Hungary in 1047 and, after another brief exile in Poland (1059), accompanied to his coronation as Béla I of Hungary in 1060. He submitted to the rule of his cousin Solomon (1064-1074), appointed by the emperor, and fought valiantly against the Cumans, but at the outbreak of intestine warfare (1073), he assisted his brother Géza to gain the throne (1074). After Géza's sudden death in 1077, Ladislas was proclaimed king of Hungary, with the unanimous consent of his country.

A staunch supporter of the papacy against the emperor, he suppressed paganism and founded several churches and cloisters. He also extended his rule into Slavonia (1089-1090); into Croatia, where he founded the bishopric of Zágráb (Zagreb; 1091); and into Transylvania where he founded the bishopric of Gyulafehérvár (Alba Iulia). Under his rule the organization and authority of the kingdom were strengthened, penal legislation was drawn up, and French culture was introduced through his establishment of the monastery of Somogyvár for the French monks of Saint-Gilles. He was canonized in 1192 and his feast day is observed on June 27.

LADISLAS (LÁSZLÓ) II: b. 1131; d. Jan. 14, 1163. The son of Béla II, he became duke of Bosnia around 1139, but subsequently lost his duchy and in 1158 went to the court of the Byzantine emperor, Manuel, with whose support he managed to usurp the throne of Hungary from his nephew, Stephen III, in 1161. His brief rule marked the height of Byzantine influence in Hungary.

LADISLAS (LÁSZLÓ) III: b. 1199; d. Vienna, Austria, May 7, 1205. The son of Emeric I, he succeeded to his father's throne in 1204 under

the regency of his uncle, who drove the child from the country in the following year and ruled as Andrew II.

LADISLAS (LÁSZLÓ) IV; called **THE CUMAN**: b. 1262; d. Körösszeg, Hungary, July 10, 1290. He was the son of King Stephen V and the Cuman princess, Elizabeth, who, after he ascended the throne in 1272, was his guardian and regent during his minority. In 1278 he helped Rudolph of Habsburg defeat Ottokar of Bohemia at the Battle of Dürnkrut (Aug. 12, 1278). Subsequently he became involved in domestic quarrels caused by his adoption of the ways and dress of his mother's people, the Cumans, a Turkic tribe which had fled to Hungary to escape the Mongols. He favored Cuman women over his wife, Elizabeth of Anjou, and sanctioned paganism. In 1282 papal pressure forced him to turn against the Cumans, but he was not converted, and in 1288 Pope Nicolas IV called for his dethronement and a crusade against the Cumans. The anarchy and internecine warfare which followed marked a decline in the moral and political life of Hungary which continued long after Ladislas' death two years later at the hands of Cuman assassins, who had not forgotten his defection in 1282.

LADISLAS (LÁSZLÓ) V. See **LADISLAS (WŁADYSŁAW) III** of Poland.

LADISLAS (LÁSZLÓ) V or VI, called **LADISLAS POSTHUMUS**: b. Komárom (Komárno), Bohemia, Feb. 22, 1440; d. Prague, Nov. 23, 1457. The posthumous son of Albert II of Hungary and of Elizabeth, daughter of the emperor Sigismund, he was crowned king when not yet three months old through the intrigues of his mother, although the Hungarian estates had already elected Ladislas (Władysław) III of Poland to the throne. For safety, the infant was placed in the care of his uncle, the emperor Frederick III. After the death of the Polish king in 1444, Ladislas became king of Hungary, but the emperor did not relinquish his guardianship of the child until 1452. Crowned king of Bohemia in the next year, the young Ladislas, under the evil influence of his grandfather, Ulrich Cillei, carried on a feud with John (János) Hunyadi, regent in Hungary during his absence. Ladislas hindered the latter's efforts to defend Hungary against the Turks and was implicated in the murder of his son, Ladislas (László) Hunyadi (1457), after which he was forced to flee to Prague where he died, presumably of the plague.

NAPLES

LADISLAS or LANCELOT: b. Naples, Feb. 11, 1377; d. there, Aug. 6, 1414. The son of Charles III and Margaret of Durazzo, he succeeded to the Neapolitan throne under his mother's regency after the assassination of his father in 1386. His reign was challenged by Louis II of Anjou, who had been the choice of the nobility and at that time occupied Naples and a large part of the kingdom, but with the aid of Pope Boniface IX he drove the invaders out (1399). In 1403 he attempted unsuccessfully to gain the Hungarian throne, and subsequently, utilizing the Great Schism and the consequent political confusion, to establish his power over the Church and Rome, which he occupied several times. He was defeated by the combined forces of Pope John XXIII and Louis II in 1412, but in the next year he again invaded Rome and sacked and burned the city.

POLAND

LADISLAS I (WŁADYSŁAW I), called **ŁOKIETEK**,

lô-kyě'těk ("the Short"): b. 1260; d. Krakow, Poland, March 2, 1333. The son of Casimir I, duke of Kujawy, he inherited the duchy of Sieradz in 1288 and in 1296 was elected Ladislas IV, duke of Poland. Later the Polish knights made Wenceslaus of Bohemia their king (1300-1305), but after the latter's death, Ladislas united Great and Little Poland under one rule. Although faced with much opposition, he was favored by the pope and was crowned on Jan. 20, 1320, Ladislas I, king of Poland, the first to re-establish the Polish monarchy after its partition into duchies in 1138. To protect Danzig from the margraves of Brandenburg, he had previously enlisted the aid of the Teutonic Knights whose subsequent territorial claims in Pomerania, however, he was unable to check (1327-1333), although he scored a major victory over the order at Płowce on Sept. 27, 1332.

LADISLAS (WŁADYSŁAW) II (or V) JAGELLO, **yā-gě'l'ō** (Pol. **JAGIELŁO**, **yā-gyě'l'ō**; Lith. **JAGELA**): b. 1350; d. Gródek, near Lwów (now Gorodok Yagellonski, Ukraine, USSR), May 31, 1434. He succeeded his father, Olgierd, as grand duke of Lithuania in 1377 and thereafter fought against the Teutonic Knights and against his uncle Kiejstut, the ruler of Samogitia, whom he treacherously murdered in 1382. In 1386 he married Jadwiga, the young queen of Poland, and by the conditions of the contract became the ruler of Poland as Ladislas II, adopted the Christian faith which he introduced into Lithuania, and incorporated Lithuania into the Polish realm. At the Battle of Tannenberg (Grunwald) in 1410, he delivered a crushing defeat to the Teutonic Knights. The founder of the Jagellonian dynasty, he had a daughter by his second wife, Maria Cillei, and by his fourth wife, Sophia, a Russian princess, he had two sons, Ladislas and Casimir, both of whom eventually succeeded to the throne.

LADISLAS (WŁADYSŁAW) III (or VI): b. Krakow, Oct. 31, 1424; d. Varna, Nov. 10, 1444. The son of Ladislas II Jagello, he succeeded (1434) to the throne under the regency (until 1438) of Zbigniew Oleśnicki. By defeating Spytek of Melztyn at the Battle of Grotnik (May 4, 1439), Ladislas brought to an end the Hussite movement in Poland, and in the next year (1440) he was elected king of Hungary. In 1443, with his chief commander John (János) Hunyadi, he crusaded against the Turks in the Balkans; but, ignoring the treaty following his victory (Peace of Szeged, 1444), he again invaded Turkish territory and was killed at the Battle of Varna.

LADISLAS (WŁADYSŁAW) IV (or VII): b. Krakow, June 9, 1595; d. Merez, May 20, 1648. He was the son of Sigismund III, whom he succeeded to the throne in 1632, having already taken part in the Muscovite wars as a claimant to the Russian throne. In his subsequent war with Russia (1632-1634) he regained Smolensk and, by the treaty of peace, conceded the czardom to Michael Romanov. Thereafter he was triumphant against the Turks (1634) and Sweden (1635), but domestic disorder prevented further expansion, and he lost Ukrainian territory as a result of the Cossack revolt under Bogdan Chmielnicki. He was a champion of religious toleration.

LADMIRAULT, **lād-mě-rō'**, **Louis René Paul de**, French general: b. Montmorillon, France, Feb. 17, 1808; d. Paris, Feb. 3, 1898. He went to Algiers (1831) as lieutenant, serving 22 years there and becoming general of a division. He

commanded a division (1859) in the war with Italy and was wounded at the Battle of Solferino. In 1870 he was given command of the 4th Corps with which he took part in the battles before Metz. On Aug. 18 he defended Amanvillers with great bravery and success against the Prussian 9th Corps. He was taken prisoner in Metz, but on his release took part in the fight against the Commune, becoming governor of Paris until 1878. He was member of the Senate 1876-1891.

LADO ENCLAVE, lă'dō ěn'klāv, area, Africa, on the west bank of the Nile, north of Lake Albert, now in Uganda and Equatoria provinces of the Anglo-Egyptian Sudan. Sir Samuel White Baker (q.v.), who first visited the town in 1864, established a military post there in 1870; he was succeeded by Charles George Gordon (q.v.), who set up, in 1878, an administration which he handed over to Emin Pasha (q.v.), styled governor of the Equatoria Province of the Anglo-Egyptian Sudan. The territory was overrun by the Mahdists when they revolted in 1885, but was recovered by the British in 1894. That same year the British government granted a lease of what was then termed the Lado Enclave (area, 15,000 square miles; pop. 250,000) to Leopold II, king of the Belgians, who administered it as part of the Congo Free State (later the Belgian Congo), of which he was independently sovereign. With his death in 1909 the lease terminated and the Lado Enclave reverted to the government of the Anglo-Egyptian Sudan.

LADOGA, lăd'ō-gā, largest lake of Europe, situated in the Union of Soviet Socialist Republics, 40 miles east of Leningrad. Greatest length, north to south, 130 miles; average breadth, about 75 miles; area, 7,156 square miles or 31 times as large as the Lake of Geneva. It receives no fewer than 70 streams, the principal ones being the Volkhov and Syas, which enter it on the south, and the Svir, which enters it on the east, bearing the surplus water of Lake Onega, and has the Neva for its outlet. It is ice free from May to October; its fauna, arctic in character, is exceptionally rich and varied. It contains numerous islands, and its shores are generally low. It abounds in fish and contains even a species of seal. Its average depth is estimated at not less than 300 feet.

The chief population centers on its banks are Shlisselburg (now Petrokrepost), Serdobol (Sortavala) and Keksgolm (Käkisalmi) in Karelia, formerly in Finland. Two canals connect the Volkhov and the Neva; two others connect the Volkhov and the Syas and another pair of canals joins the Syas and the Svir. These form a navigable chain around the south of the lake. Until the Finnish-Russian war of 1940 part of the lake was in Finland.

LADRONES. See MARIANAS ISLANDS.

LADY, in British usage, a title of honor. It is used informally of a marchioness, countess, viscountess, or baroness. The daughter of a duke, marquis, or earl has lady prefixed to her Christian name and surname. The wife of a younger son of a duke or marquis has lady prefixed to her husband's Christian name and surname. The wife of a baronet or knight is commonly known as lady with her husband's surname; the formal title is dame with the wife's Christian name and

the husband's surname. The word comes from the Anglo-Saxon *hlafdige*, meaning breadkneader, which applied to the mistress of the house.

LADY-BIRDS, beetles of the family Coccinellidae, the majority of which are beneficial. They are mostly roughly circular in outline and strongly convex above: the smallest is 1/25 of an inch long, the largest, from southern Asia, a half inch. Probably the best known is the two spotted lady-bird beetle (*Adalia bipunctata*) which is almost cosmopolitan: it is red with a black spot on each wing-cover. The most famous is the vedalia (*Rodalia cardinalis*).

Lady-bird: adult, larvae, eggs, and pupa.

The lady-bird was imported from Australia and is credited with saving the citrus industry of California by practically wiping out the cottony cushion scale. The species *Hippodamia convergens* occurs throughout the United States but is most famous in California. The adults hibernate in enormous numbers on the high mountains. They are collected in the early spring and distributed among fruit growers for control of aphids. The eggs are yellow and are laid in small batches. The larvae are elongate, usually tapering behind, and are very active. Both adults and larvae feed on aphids, mites, mealy bugs, scales and other small insects. The most notorious is the destructive Mexican bean beetle (*Epilachna varivestris*) which spread over the eastern United States in the early 1920's.

LADY BOUNTIFUL, a character in *The Beaux' Stratagem* (1705) by George Farquhar (q.v.). Widow and beneficiary of Sir Charles Bountiful and his will, she dispenses her wealth curing the Lichfield inhabitants of their maladies.

LADY CHAPEL, a chapel dedicated to the Virgin Mary, and when attached to cathedrals, generally placed eastward from the altar. The lady-chapel of Westminster Abbey is that usually known as Henry VII's. St. Patrick's Cathedral in New York possesses a most ornate lady chapel.

LADY CRAB, a common name for the *Platyonichus ocellatus*, an American species of edible crabs beautifully covered with rings of red and purple. It is one of the group *Calinectes hastata*. There are, however, other crabs, which are so termed because they all bear what is considered as an outline of the head and shoulders of a woman.

LADY DAY, one of the quarter-days in England and Ireland, on which rent is made payable. It falls on March 25 in each year. In the Roman Catholic Church it is held as a great festival under the title of the Feast of the Annunciation. In the Anglican Church it is ob-

served as a feast. In France the day is termed Notre Dame de Mars.

LADY FERN, vulgar name for *Asplenium filix-foemina*. It has ovate-oblong or broadly lanceolate, twice pinnate fronds, and is found in moist woods of Europe and North America. It is claimed by some to have the properties of a vermifuge. The British place this fern in the genus *Athyrium*. Scott refers to it in the words:

"Where the copse-wood is the greenest,
Where the fountain glistens sheenest,
Where the mountain dew lies longest,
Where the lady fern is strongest."

Edwin Lees calls it "the sweet lady fern" and William Howitt says: "Do not pluck the strawberry flower nor break the lady fern."

LADY OF LYONS, *The*, a play, by Bulwer-Lytton, originally called *The Adventurer*. It was first produced in 1838.

LADY OF MERCY, *Order of Our*, a Spanish order dating from 1218. It was founded by James I of Aragon, in compliance with a vow made during his captivity in France. Pope Gregory IX approved the order in 1230. It was instituted to redeem Christian captives from the Moors. The order was extended to women in 1261. A branch order instituted in France was pressed at the time of the French Revolution. It is now a missionary order, mainly in South America and South Africa.

LADY OF SHALOTT, *The*, a maid who died for love of Sir Lancelot of the Lake. It is the title of one of Tennyson's poems (1832).

LADY OF THE AROOSTOOK, à-rōōs'-ōk, title of a novel by William Dean Howells (i.v.), appearing first in the *Atlantic* (1878-79), then in book form (Boston 1879).

LADY OF THE LAKE, *The*. Sir Walter Scott's *Lady of the Lake*, published 1810, was the third of his metrical romances, following the *Waverley* and the *Last Minstrel* and *Marmion*. It was the result of a trip which Scott had made, on legal business, into the Highland country, where he had been impressed by the romantic character of the scenery and its appropriateness to the poetic treatment of historic associations. This poem," he said, "the action of which lay among scenes so beautiful and so deeply imprinted on my recollections, was a labor of love, and it was no less so to recall the manners and incidents introduced. The frequent custom of James IV, and particularly of James V, to walk through their kingdom in disguise, afforded me the hint of an incident which never fails to be interesting,—that is, the participation, on the part of royalty in disguise, in a romance among humbler folk. The poem may be said to reach the high-water mark of Scott's success in blending the interest of scenery, action and simple human feeling, so far as his metrical works are concerned, though it contains nothing so fine of its kind as the account of the Battle of Flodden in *Marmion*. The characters of the king and of Roderick Dhu are brilliantly sketched; that of the young lover, Scott, as usual, found difficulty in handling. "You must know," he wrote to a friend, "this Malcolm Graeme was a great plague to me from the beginning. . . . I gave him that dip in the lake by way of making him do something; but wet or dry, I could make nothing of him." He also re-

lated, to illustrate his care for accuracy of detail, that he himself rode into Perthshire "to see whether King James could actually have ridden from the banks of Loch Vennachar to Stirling Castle within the time supposed in the poem."

The Lady of the Lake, like the earlier romances, met with instant success, and has proved lastingly popular. Its epilogue is one of Scott's few distinguished achievements in purely lyric poetry.

LADY OF THE LAMP, *The*, a name given to Florence Nightingale (q.v.), alluding to her nightly visits to hospitalized wounded soldiers during the Crimean War. Longfellow's *Santa Filomena* popularized it.

LADY OR THE TIGER, *The*, title of a story by Francis Richard Stockton (New York 1884). It received exceptional popularity heightened by the fact that the sequel or decision is left to the reader, thereby creating a considerable fund of conjecture and discussion. The title has become a pet phrase to express a dilemma.

LADY WINDERMERE'S FAN. Oscar Wilde had made himself notorious in affecting to write only to the few. In *Lady Windermere's Fan* he throws his dart directly at popularity with the many. Nothing in Wilde's career is more perverse and more characteristic than the extraordinary success of his series of comedies beginning in 1892 with *Lady Windermere's Fan*. This success is secured by an impudent practice of all the codes he had preached in his early career. And now his affronts to the public bring him fortune as well as fame. In the 1880's Wilde had been the *enfant terrible* of the British Isles; he had shocked the pruders; he had pained the apostles of beauty for man's sake with his impious contempt for the British middle class man. He had got himself lampooned and made the central figure of the Gilbert and Sullivan opera, *Patience*, but still he was poor. Now at the age of 38 he turns respectable as to morals and conventional as to artistic manners. Nothing could be more lofty, more smug, more British middle class than the morals of *Lady Windermere's Fan*; nothing could be more *au fait* according to the current English imitations of French serious drama than the innocent-guilty intrigue that it propounds. The men are long-winded praters, wise and witty and sophisticated as to words, impeccable as to their private lives. The women are dowagers and faithful wives. If any has sinned it was very long ago. The young girls are silent. In all these respects Wilde was giving the respectable English audience what it wanted. He knew that the audience would accept any amount of banality in the theater if only it were given a dash of piquant French sauce. It would enjoy risqué allusions but only as verbal badinage. Wilde was never more witty and ingenious than he was in *Lady Windermere's Fan* and the succeeding plays. Never, save in *The Importance of Being Earnest*, which is a true farce, was he less honest. In his earlier work, with all his absurdities, he had been a corrective for characteristic British faults. In his society plays he pampers and coddles these faults and prospers upon them. Wilde's wit and paradox and epigram have become famous. The verbal brilliancy of his plays is what gives them continuing life. The stories are second-rate; the characters are not differentiated. All

are artificial creations in a fictitious code. But the author's own quips of observation, his turn of phrase and observation, the heartless polish of his contemptuous comedy, make the play memorable among the few examples of English comedy of manners. *Lady Windermere's Fan* was produced by Sir George Alexander (1858-1918) at the St. James's Theatre, London, Feb. 22, 1892; it was revived at the same theatre Nov. 19, 1904 and Oct. 14, 1911. First production of the play in the United States was at the Columbia Theatre, Boston, in 1893. Subsequently it was revived frequently in several countries.

THOMAS H. DICKINSON.

LADYPISH, BANANA-FISH or BONE-FISH, the name of several different marine fishes conspicuous for elegance of outline and handsome coloring. They are found mainly in the tropical regions.

LADY'S FAN, The. See GIANTS CAUSEWAY.

LADY'S or FAIRY'S, FINGERS, GLOVE, or THIMBLE, are some among many gardener's names for the purple foxglove (*Digitalis purpurea*), in regard to which much provincial folklore might be cited. See DIGITALIS; FOX-GLOVE.

LADY'S MANTLE, popular name for the *Alchemilla pratensis* (Schmidt) of the *Rosaceae* family. The *Alchemilla vulgaris* L. is also so called. This term is derived from the fact that there is supposed to be a similarity to a mantle in the shape of its leaf. It is a perennial with orbicular-reniform leaves, 5-9 lobed, more or less pubescent, serrate. Flowers are two inches broad. It grows in grassy places near the Nova Scotia, Cape Breton, and eastern Massachusetts coast, but was naturalized from Europe. The *Alchemilla alpina* L. is found on Miquelon Island and on the White and Green mountains; it is distinguished by its beautiful five oblong silky entire leaflets. The *Aphanes arvensis* L., or parsley-piert, is also called *field lady's mantle*. This is found in dry fields of Nova Scotia, Georgia, Tennessee; it has claims to astringent and diuretic properties.

LADY'S SLIPPER, or MOCCASIN FLOWER, an orchid of the genus *Cypripedium*, several species of which grow both wild and cultivated in the United States. See ORCHIDS.

LADY'S SMOCK. See CUCKOO-FLOWER.

LADYSMITH, Canada, city of British Columbia, on Oyster Harbor, Vancouver Island, in the Nanaimo district, 16 miles south of Nanaimo; it is on the Island Highway and the Esquimalt and Nanaimo Railway. Ladysmith is 50 miles northwest of Victoria, B.C. The city was incorporated in 1904, and the streets are named after generals who took part in the South African War. The city owns its own sewerage system, and the retail distribution system for electricity, purchased in bulk from a utility company. Formerly a coal-mining and shipping center, Ladysmith became the center of an extensive logging industry. There are several small coal mines in the district, as well as large tributary farming areas to the north and south. Oyster cultivation is carried on in the harbor, and a plant operates for the crushing and selling of

shell. A weekly newspaper, the *Ladysmith Chronicle*, serves a large area. Pop. 1,685.

LADYSMITH, Union of South Africa, town of Natal province, near the Klip River, 201 miles northwest of Durban. Situated 3,284 feet above sea level, some 30 miles from the foot of the Drakensberg Mountains, it is sheltered from severe winds and enjoys a dry and bracing winter climate; the summer heat, however, is frequently oppressive. An important railroad center, lines radiate to the Transvaal, the Orange Free State, and the sea coast. Besides railroad workshops, the town contains engineering works, creameries, and lumber mills. Founded in 1851, Ladysmith was named for the wife of Sir "Harry" (Henry George Wakelyn) Smith, Juana Maria de Los Dolores de León, a Spanish girl whom he rescued during the Peninsular War. In the early stages of the South African War (q.v.) 10,000 British troops under Sir George (Stuart) White (q.v.) were besieged in the town by Transvaal forces numbering 20,000 commanded by Gen. "Piet" (Petrus Jacobus) Joubert (q.v.). The siege began on Nov. 2, 1899, and despite repeated efforts by a relieving army under Sir Redvers Henry Buller (q.v.) continued until Feb. 28, 1900. Some 3,200 British soldiers were killed or died of disease in the defense and relief of the town. Pop. (1936) 9,702.

LAOKEN, lă'kên, Belgium, a northern suburb of Brussels. Within it is a royal chateau and park, the former built in 1782 and later improved by Napoleon Bonaparte for the use of Josephine; subsequently it was a residence of the royal family of Belgium, being restored in 1890 after a destructive fire. In the vicinity of Laeken stands the Column of the Congress, a colossal monument, erected in 1859, surmounted by the statue of Leopold I by Willem Geefs, Belgian sculptor (1806-1883).

LAELIUS, lē'li-ūs, (1) **Gaius**, Roman general and statesman; d. after 170 B.C. He was a friend of Scipio Africanus the elder, and fought under the latter in most of his campaigns. In 190 B.C. he was made consul in consequence of his successes in the Spanish campaign (210-206 B.C.) and in Sicily and Africa. He defeated Syphax in 203. In 170 he was ambassador to Transalpine Gaul. (2) **Gaius**, surnamed Sapiens (the Wise), son of the preceding Roman statesman and student; b. about 186 B.C.; d. 115 B.C. He was an intimate friend of Scipio Africanus the Younger which comes out clearly in Cicero's treatise *Laelius sive de Amicitia*. In 151 he was tribune of the plebs, in 145 praetor, and in 140 was consul. His love of literature and philosophy is noted; as well as his friendship and social intercourse with talented contemporaries, as the philosopher Panaetius, the historian Polybius, the poets Terence and Lucilius. His early life was devoted to the study of philosophy and law. Besides figuring in *De Amicitia*, as interlocutor, he is a speaker in *De Senectute* and in *De Republica*. He had some talent for military work, as proved by his campaign against the Lusitanian Viriathus. He imbibed the doctrine of the Stoics from Diogenes of Babylon and Pandetius. Early in his career he attempted to procure a division of the public land among the people but threat of disturbances caused him to drop the measure; later he became an adherent of the aristocratic party.

How highly his course of life was honored is clearly shown in one of Seneca's injunctions to his friend Lucilius "to live like Laelius."

LAENNEC, lā-nĕk', René Théophile Hya-cinthe, French physician: b. Quimper, France, Feb. 17, 1781; d. Kerlouanec, near Douarnenez, Aug. 13, 1826. He took his degree of doctor of medicine in 1804, and by 1812 was a physician at the Hôpital Beaujon. In 1816 he was appointed chief physician to the Hôpital Necker, and soon after made the notable discovery of mediate auscultation, that is, of the use of the stethoscope. The original discovery, however, is claimed for Leopold Auenbrugger (q.v.). In 1819 he published his *De l'auscultation médiate ou traité du diagnostic des maladies des poumons et du coeur*, having read a memoir on the subject to the Academy of Sciences in the previous year. In 1822 he was appointed professor of medicine at the Collège de France. The remainder of his life was devoted to the perfecting of this new system of diagnosis, and so far as diagnosis is concerned his treatise has produced an effect not attained by any other work.

The special study of Laënnec was diseases of the chest, and by means of auscultation, either by the direct application of the ear, or of the stethoscope as an auxiliary, he elucidated the pathology of these diseases, which were previously involved in the greatest obscurity. His biography, *Laënnec, son vie, son ouvrage*, by Henri Saintinon, was published in Paris 1904.

LAERTES, lā-ūr'tēz, king of Ithaca and father of Odysseus (Ulysses). He had been one of the heroes engaged in the chase of the Calydonian boar, and in the expedition of the Argonauts. The absence of his son in the Trojan War plunged him into melancholy, but the return of Odysseus restored his energies, and he took part in the fight with the suitors of Penelope.

LAESA MAJESTAS, lē'sā mā-jēs'tās, Latin term meaning injured majesty. It is a phrase taken from the Roman law and entering modern civil law to designate an offense against the person or dignity of the king, therefore high treason. Out of court, the common term is **LESE MAJESTY**.

LAETARE SUNDAY, lē-tā'rē, called also Mid-Lent, the fourth Sunday in Lent. The introit for the day in the Roman Catholic Church begins with the words, "Laetare (rejoice), Jerusalem," from Isaiah 66:10; hence the name.

LAFARGE, lā-fārz'h', Marie Fortunée (nee CAPPELLE), French victim of circumstantial evidence: b. Villers-Helon, 1816; d. Ussat, Nov. 7, 1853. Of distinguished family and highly educated, she married (1839) an ironmaster of Corrèze and was accused of poisoning him when he died (1840) from eating poisoned sweetmeats. She had purchased arsenic from a pharmacy and could not clearly account for its use; her neighbors testified against her, and she had been accused of the theft of diamonds in June 1839 from a lady friend which were then, in part, discovered in her residence and was sentenced to two years' imprisonment for the theft. The evidence of witnesses as to the poison was contradictory and her lawyer, the celebrated Alphonse

G. V. Paillet of Paris, made a good defense. But the animosity of the judge prevailed and she was adjudged guilty and sentenced to hard labor for life, and later evidence in her favor did not stay the punishment. Friends gained her release after 12 years in prison, but she soon died from the experience she had gone through. While in prison she wrote *Memoires* (1841).

LAFAYETTE, lā-fi-ēt' (Fr. là-fā-yēt'), MARQUIS DE (MARIE JOSEPH PAUL YVES ROCH GILBERT DU MOTIER), French soldier and statesman: b. Chateau Chavaniac, near Brionde, Auvergne (in the present Department of Loire), Sept. 6, 1757; d. Paris, May 20, 1834. He belonged to an eminent family of France. He was educated in the Collège du Plessis, in 1771 entered the army as an officer of the King's Musketeers, and on hearing of the Declaration of Independence by the American colonists, determined to lend them his assistance.

In 1777 he left France for America with 11 companions, among whom was Baron de Kalb; set sail from Pasajes, Spain, in a ship equipped by himself; and arrived at Georgetown, S. C., June 13. He proceeded to Philadelphia, and to the Congress there in session volunteered his services without pay. On July 31, he was commissioned major general, and not long after became a member of Gen. George Washington's staff. He was slightly wounded at Brandywine (Sept. 11), while rallying the American forces from a retreat, was appointed to the command of an abortive expedition for the invasion of Canada, never executed owing to lack of means, and in April 1778 was ordered to join Washington at Valley Forge. On May 19 he was surprised by Gen. James Grant with 5,000 troops at Barren Hill (see LAFAYETTE AT BARREN HILL), 12 miles from Valley Forge, where he had taken post with 2,100 troops and five cannon. Though nearly surrounded by a superior force, he succeeded in extricating himself, recrossing the Schuylkill and reaching Valley Forge in safety.

War between France and England having broken out, Lafayette returned (January 1779) to place himself at the disposal of the French government; obtained for the American cause financial assistance and the reinforcement of a fleet and 6,000 troops under the comte de Rochambeau, and on May 11, 1780 he rejoined the American army. He was shortly afterward stationed at Tappan, with a light infantry corps of observation, and was a member of the court of general officers by which Maj. John André was tried and condemned to death (September 29). On Feb. 20, 1781 he was sent by Washington with 1,200 New England and New Jersey troops to aid in the defense of Virginia. Reinforced, he pursued Gen. Charles Cornwallis from near Charlottesville to Yorktown, thus contributing to the decisive operations by which the war was virtually concluded.

He sailed from the United States in December 1781, but revisited America in 1784, when he was enthusiastically received. Lafayette was called to the Assembly of the Notables in 1787, and was elected a member of the States General, which took the name of National Assembly (1789). Two days after the attack on the Bastille he was appointed (July 15) commander in chief of the National Guard of Paris, and gave them the tricolor cockade. It was through

his means that the lives of the king and queen were saved from the mob that had taken possession of the palace at Versailles (October 5-6). After the adoption of the Constitution of 1790 he resigned all command and retired to his estate of La Grange. He had previously resigned his title, the abolition of titles having been decreed by the National Assembly. The first coalition against France (1792) soon called him from his retirement. Being appointed one of the three major generals in the command of the French armies, he established discipline and defeated the Austrians and Prussians at Philippeville, Maubeuge, and Florennes, when his career of success was interrupted by the factions of his country.

During the Reign of Terror commissioners were sent to arrest him, but he escaped to Flanders. Having been captured by an Austrian patrol (August 1792), he was delivered to the Prussians, by whom he was again transferred to Austria. He was carried with great secrecy to Olmütz (Olomouc), where he was subjected to much privation and suffering, and whence he was not released until Aug. 25, 1797. He returned to his estate at La Grange two years later, and taking no further part in public affairs devoted himself to agricultural pursuits. He sat in the French Second Chamber from 1818-1824 and from 1825 until his death he sat in the Chamber of Deputies.

In August 1824 he landed at New York on a visit to the United States, upon the invitation of President James Monroe at the request of Congress, and was received in every part of the country with the warmest expression of delight and enthusiasm. Congress voted him \$24,424 and a township of land, his own fortune having been mostly lost by confiscation during the Terror. During the Revolution of July 1830 he was appointed general in chief of the National Guard of Paris, and though not personally engaged in the event, was, through his activity and name, of the greatest service. When the National Guard was established throughout France, after the termination of the struggle, he was appointed their commander in chief. Of Lafayette, Edward Everett said: "Who, I would ask, of all the prominent names in history, has run through such a career, with so little reproach justly or unjustly bestowed."

(Paris 1832); *Mémoires, correspondance, et manuscrits du Général Lafayette*, collected and published by his family, 6 vols. (Paris 1837-38); Tuckerman, B., *Life of Lafayette* (New York 1889); Tower, Charlemagne, *The Marquis de La Fayette in the American Revolution*, 2 vols. (Philadelphia 1895); Whitman, Walt, *Lafayette in Brooklyn* (New York 1905); Sedgwick, H. D., *La Fayette* (Indianapolis 1928); Chinard, Gilbert, ed., *Letters of Lafayette and Jefferson* (Baltimore 1929); Gottschalk, Louis, *Lafayette and the Close of the American Revolution* (Chicago 1942); Gottschalk, Louis, ed., *Letters of Lafayette to Washington* (New York 1944).

LAFAYETTE, city, Indiana, and Tippecanoe County seat, altitude 661 feet, on the Wabash River, and served by the Chicago, Indianapolis and Louisville, the Cleveland, Cincinnati, Chicago and St. Louis, the New York, Chicago and St. Louis, and the Wabash railroads, situated 58 miles northwest of Indianapolis, with an airport. The surrounding area is agricultural, and the city is a market and shipping point for grains, cattle, and hogs. It is an industrial center, with railroad shops, packing houses, and

factories that turn out aluminum products, electric meters, steel and wire goods, automobile gears, soybean oil, drugs, soap, beer, sponge rubber products, and strawboard.

The city has a well-stocked public library, an art museum, and a museum with collections maintained by the county historical society. Lafayette is the seat of Purdue University (q.v.). The State Agricultural College is associated with it. St. Francis Normal School is also here. A state soldiers' home is located here; also, a privately maintained home for children. There are hospitals, good churches, hotels, and social and civic organizations.

Eight miles north of the city, on Nov. 7, 1811, was fought the Battle of Tippecanoe between 900 Americans under William Henry Harrison (q.v.) who was then governor of the Territory of Indiana, and a force of Indians under the brother of Tecumseh (see TIPPECANOE, BATTLE OF); a monument marks the battleground. Four miles south of the city is the site of old Fort Ouiatenon, one of the first white settlements in the state of Indiana. There is no actual surviving relic of the fort, supposed to have been erected in 1720, after Sieur de La Salle had induced the Indians to move over into Illinois; but the site is marked. The French fort was taken by the British in 1760, and in 1763 it was captured by the Indians; it was destroyed in 1791. Lafayette was platted in 1825 and incorporated as a city in 1853. Its government is administered by mayor and council. The water supply system is municipally owned; the power and light systems are privately owned. Pop. (1950) 35,568.

LAFAYETTE, city, Louisiana, seat of Lafayette Parish, at an altitude of 38 feet, on the Vermilion River, 55 miles west-southwest of Baton Rouge. It has a municipal airport, and is served by the Southern Pacific Railroad and state highways. The surrounding agricultural area produces sugar cane, rice, cotton, corn, and sweet potatoes. The city is a shipping center of considerable importance. Industrial plants include railroad repair shops and manufactures of sashes and doors, signs, and concrete pipes. It also has cotton gins, cottonseed presses, sugar refineries, creameries, and packing plants. Nearby are oil and gas fields and sulphur and salt mines.

Southwestern Louisiana Institute (q.v.), a coeducational institution of academic and technical instruction, and teacher training, is located at Lafayette. The city has a public library, musical associations, and other civic and social clubs. St. John's Cathedral (1916) is its most notable building and the Lafayette Charity Hospital located here is a state institution.

The earliest settlers at this spot were probably Salvator Mouton and his wife, Anne, during the 1770's. They came from Halifax, Nova Scotia, fleeing from English persecution and soon other exiled Acadians joined them here. Descendants of the Mouton family have been very prominent in Louisiana history. There is a Mouton Monument honoring Brig. Gen. Jean Jacques Alfred Mouton, who was drillmaster of the vigilantes against cattle rustlers in 1859, and who met his death at the Battle of Mansfield in 1864. Lafayette was incorporated as a town in 1836, renamed in 1884, and incorporated as a city in 1914. It has commission form of government. Pop. (1940) 19,210; (1950) 33,541.

LAFAYETTE AT BARREN HILL.

The first independent command of the Continentals entrusted by Gen. George Washington to the marquis de Lafayette as a major general was with 2,100 of his best troops (out of 11,800 effectives trained by Baron Friedrich W. von Steuben), with five pieces of artillery, to take a position on Barren Hill (now known as Lafayette Hill), 10 miles from Philadelphia. The object was to cut off British foraging parties and make reconnaissance to see if Sir William Howe was about to evacuate the city. The British got wind of the projected movement and a ship was kept waiting in the Delaware River for 10 days, the commander hoping to take Lafayette as a prisoner to England.

On May 1, 1778, a day of joy, news of the French Alliance was read in camp. On the 18th Lafayette sallied out and secured a strong position on Barren Hill. On the 19th, 5,000 British and Hessians marched by three roads to envelop the young Frenchman and his force, one detachment west of the Schuylkill expecting to cut off his retreat at Matson's Ford. The plan, skilfully conceived, seemed certain of success, when Lafayette, detecting the red uniforms, quickly occupied the strongest positions and sent out false heads of columns, which delayed the British advance until reinforced and able to deploy. The race was now for Matson's Ford. The enemy rallied by two roads to cut off the Americans, but the retreat was so skilfully conducted, Lafayette bringing up the rear, that, despite the heavy cannonade from the British batteries of field artillery and the swift charges of the Hessians, the young Frenchman, by his wisdom, coolness, and promptness, saved the day. One incident illustrates this. A British round shot, hitting the axle, disabled one of the five cannon of the Continentals. To abandon a gun would mean defeat both to Lafayette and to Washington. Ordering the artillerists to leap from their caissons and horses into the farm yard of John Harby, a farmer, Lafayette commandeered his wagon and had the gun quickly lashed by the breech to the hind axle. Then, whipping up the horses, the cannon was dragged seven miles over the rough road to Matson's Ford.

In the skirmish at the river side the American rear-guard lost nine men. That of the British was reported as three, but the retreat was perfected and all the guns saved, together with the troops, to the joy of Washington and the confirming of his trust. A few days later the army started in pursuit of Howe.

Consult Carrington, Henry B., *Battles of the American Revolution* (New York 1876).

WILLIAM ELLIOT GRIFFIS.

LAFAYETTE COLLEGE, a Presbyterian college at Easton, Pa., founded in 1826. Its faculty (1950-1951) was 145 and its student body enrollment was 1,659 men. The endowment of more than five millions has come from gifts of private individuals and the General Education Board. It was chartered in 1826, but owing to the failure of the legislature to make any appropriation, the college was not opened until 1832. Since the Civil War the college has had a notable growth. The college curricula offer courses leading to the degree of bachelor of arts, and the B.S. apportioned to departments as bachelor of science in chemistry and physics, bachelor of science in civil engineering, chemical engineering,

electrical engineering, mechanical engineering and mining and metallurgical engineering. The various buildings include Pardee Hall, a memorial library with over 125,000 volumes, a memorial chapel, the Gayley Laboratory of Chemistry and Metallurgy, the Mechanical Engineering building, and Kirby Hall.

LAFFAN, lăf'ăn, William Mackay, American newspaper publisher and art connoisseur: b. Dublin, Ireland, Jan. 22, 1848; d. New York, Nov. 19, 1909. He was educated at Trinity College, Dublin, and emigrated to America (1868) where he worked on the San Francisco *Chronicle* as reporter, and becoming city editor, then managing editor of the *Bulletin*. In 1870 he went over to the Baltimore *Daily Bulletin*, becoming owner and editor, in which capacity he made vigorous war on the political clique that was injuring the city. He became a member of the staff (1877) of the New York *Sun*, then (1881) art editor for Harper Brothers, but was publisher of the New York *Sun* in 1884, establishing the *Evening Sun* in 1887. By 1902 he had purchased the Charles A. Dana estate's interests in the *Sun*, and became president of the Sun Printing and Publishing Co. He was a prominent connoisseur and collector of Chinese porcelains and was a trustee of the Metropolitan Museum of Art from 1905. He wrote *Oriental Ceramic Art* (1897), and the introduction to the *Catalogue of Porcelains of the Morgan Collection* then at the Metropolitan Museum of Art (New York 1904).

LAFFITTE, là-fê', Jacques, French banker: b. Bayonne, Oct. 24, 1767; d. Paris, May 26, 1844. He entered the banking house of the senator, Jean F. Perregaux, and in 1804 became the head of the firm, which he made one of the first houses in France. In 1809 he was appointed regent of the Bank of France, and in 1814 governor of the same establishment. When the credit of France, in 1815, was at a very dangerous crisis, Laffitte advanced 2,000,000 francs in ready money, by which means a necessary article in the capitulation of Paris was settled. He was elected to the Chamber of Deputies in 1816. In 1819 he was deprived of the presidency of the bank, which was bestowed on the duke of Gaeta, yet he was in 1822 unanimously re-elected to the office of *régent de la banque*. Laffitte was again elected to the Chamber of Deputies in 1827, and took an active part in the Revolution of July 1830, being one of the deputies who signed the protest, and declared themselves deputies of France, in spite of Auguste J. A. M. Polignac's order to annul the election. He founded a new credit bank in 1837, and was president of the Chamber of Deputies in 1843. He became bankrupt in his latter days, and was obliged to sell all his property to pay his debts, but his Paris home was preserved to him by a national subscription.

LAFFITTE, or **LAFITTE**, Jean, American pirate and smuggler: b. France, c.1780; d. probably Silan, Yucatán, 1826 (according to some authorities, at sea in 1817). He was at one time a privateer in the employ of Cartagena for the destruction of British and Spanish commerce. Soon he turned to piracy, and by 1812 was leader of a band of desperadoes who maintained headquarters on the island of Grand Isle in Barataria Bay, plundering traders in the Gulf of Mexico.

During the War of 1812, Commodore William H. Percy, commanding the British naval force in the gulf waters, unsuccessfully endeavored to obtain Laffitte's cooperation in the expedition against New Orleans. Laffitte later offered his services to the governor of Louisiana and Gen. Andrew Jackson, on condition of full pardon for himself and his followers. He assisted in the construction of the defenses of Barataria Bay, and in command of a detachment of his band participated most creditably in the Battle of New Orleans (Jan. 8, 1815).

President James Madison by proclamation confirmed the amnesty granted to the outlaws, but Laffitte continued to carry on his piracy from the island of Galveston against the Spaniards. He was a bold smuggler, and brought to Louisiana cargoes of Negro slaves. He was associated with a brother, Pierre, with whom he is often confounded. He is the hero of Joseph H. Ingraham's story *Lafitte: or, The Pirate of the Gulf* (1836). Other books romanticizing Laffitte include M. V. Charnley's *Jean Lafitte, Gentleman Smuggler* (New York 1934); T. M. Hunter's *Saga of Jean Lafitte* (San Antonio, Texas 1940); and Lyle Saxon's *Lafitte, the Pirate*, 2d ed. (New Orleans 1950). See also BARATARIA, PIRATES OF.

LAFITAU, là-fê-tô', **Joseph François**, French missionary and writer: b. Bordeaux, 1670; d. there, July 3, 1746. He belonged to the Society of Jesus and was for some years (1712-1717) attached to their missions among the Iroquois in Canada, and was afterward procurator of the Canadian missions. On his return to France he published *Mémoire concernant la précieuse plante ginseng de Tartarie* (1718), the plant here noticed, which was highly valued by the Chinese, having been found by Lafitau in the Canadian forests; *Mœurs des sauvages Américains comparées aux mœurs des premiers temps* (1723); *Histoire des découvertes et conquêtes des Portugais dans le nouveau monde* (1733).

LAFLAMME, Toussaint Antoine Rodolphe, Canadian jurist: b. Montreal, May 15, 1827; d. Dec. 7, 1893. Educated at the College of St. Sulpice, Montreal, he was admitted to the bar in 1849, and became a member of the "Rouge" or liberal reform element in Quebec Province. At the same time he continued his legal practice, and was appointed professor of the law of real property in McGill University. He was one of the founders of the Institut Canadien de Montreal and in 1872-1878 sat in Parliament for Jacques Cartier County. In 1876 he was minister of inland revenue under Alexander Mackenzie and in 1877-1878 was minister of justice.

LAFONTAINE, là-fôn-tên', **August Heinrich Julius**, German clergyman and novelist: b. Brunswick, Oct. 5, 1758; d. Halle, April 20, 1831. He studied theology (1777-1780) at Helmstedt, became private instructor in several locations until 1789. He joined the Prussian Army as field chaplain and settled (1801) in Halle. He was made canon of Magdeburg Cathedral as reward for dedicating a work to Friedrich Wilhelm III and Queen Louise. He was a prolific but popular writer, being author of over 150 volumes. Sentiment and domestic life are his themes served up in the narrow lines of the period. Writing under the pseudonyms GUSTAV FREIER, MILTENBERG, or SELCHOW, his best tales

are *Gemälde des menschlichen Herzen* (1792 and later, 15 vols.); *Familiengeschichten* (1 vols., 1797-1804); *Der Sonderling* (1793); *Der Naturmensch* (1791).

LAFONTAINE, Henri, Belgian jurist: b. Brussels, April 22, 1854; d. there May 5, 1944. He was appointed (1878) secretary of the Gesellschaft für Förderung der Mädchenarbeiter Schulen, and (1889) secretary of the Belgian Peace Society. In 1893 he became professor of international law, and was made (1895) senator, also director of the International Bibliographical Institute, and in 1907 was appointed secretary of the Union of International Associations. He shared with Elihu Root (1913) the Nobel Prize for his work in the advancement of international peace. He wrote *Pacifisme internationale* (1902); *Bibliographie de la paix et de l'arbitrage international* (1904); *The Great Solution, Magnissima Charta* (1916); and *Code des vœux internationale* (1923).

LAFONTAINE, Sir Louis Hypolite. See LA FONTAINE, SIR LOUIS HIPPOLYTE.

LAFUENTE or **LA FUENTE**, lä fwän tä, **Modesto**, Spanish historian: b. Rabanal de los Caballeros, May 1, 1806; d. Madrid, Oct. 25, 1866. After receiving his education in philosophy and theology he was appointed professor of philosophy at the University of Astorga (1832) and two years later succeeded to the chair of theology there. Abandoning this some years afterward, he went to Madrid where he began writing political and theatrical criticism for the newspapers under the pen names of FRAY GERUNDIO and TIRABEQUE. These essays were collected as *Collección de capilladas y disciplinazo* (1837-1840) and as *Teatro social del siglo XIX* (1846). But his chief title to fame rests on his *Historia general de España*, 30 vols. (1850-1866), a monumental work, later edited and revised by Juan Valera in 25 vols. (1887-1891). Other works by Lafuente include *Viaje aerostático de Fray Gerundio y Tirabeque* (1847), and *Revista europea* (1848-1849).

LAGARDE, lä-gärd', **Paul Anton de**, German Orientalist: b. Berlin, Nov. 2, 1827; d. Göttingen, Dec. 22, 1891. He studied theology and Oriental and Semitic languages at Berlin, London, and Paris, coming to Halle University in 1853 to lecture. He taught at several schools of science, from 1866, at Berlin and Schleusingen, and in 1869 was made professor of Oriental languages at Göttingen University. Besides editing the works of the Italian philosopher Giordano Bruno (1888-1889), he wrote an astonishing number of many-sided philological works including *Gesammelte Abhandlungen* (1866); *Aegyptiaca* (1875); *Armenische Studien* (1877); *Semitica* (1878-1879); *Orientalia* (1879-1880); *Symmicta* (1877-1880); *Persische Studien* (1884); *Mittelungen* (1884-1891); *Bibliotheca Syriaca* (1892). He also wrote several poems which were published by his wife in 1897, at which time he worked on books of the Bible.

His great learning and gifts were curious mixed with dogmatism and distrust in the activities of others. His *Deutsche Schriften*, 4th ed. (1903) deals with the position of the German state to theology, the church, and religion. His library now belongs to the New York University.

LAGARTO, là-gär'tò, the Spanish word for lizard. It was applied by the early Spanish explorers of Central America to the alligator (*el lagarto de Indias*), and their use of the word clung to the literature of the natural history of the New World for many years.

LAGERLOF, lä'gër-löv, **Selma Ottiliana Lovisa**, Swedish authoress: b. Mårbacka Manor, Värmland, Nov. 20, 1858; d. there, March 16, 1940. Her father was a Swedish army officer and her mother came of a family of artists and clergymen. She was educated at the Royal Women's Superior Training College, Stockholm. She became a teacher at the Girls' High School at Landskrona (1885-1895), and during this time prepared her first book, *Gösta Berlings saga*, 2 vols. (1891; Eng. tr. as *Gosta Berling*, 1898). A story of various Värmland legends and myths, its refreshing breath of romance was a pleasant change from the pessimistic realism which had been the vogue, and brought the author prompt and remunerative success. A year's travel in Egypt, Palestine, and Greece provided her with material for the second volume of her *Jerusalem*, 2 vols. (1901-1902; Eng. tr. 1903), and also for portions of *Kristuslegender* (1904; Eng. tr. as *Christ Legends*, 1908). Out of travel and a study of conditions in Italy and especially in Sicily came the *Antikrists mirakler* (1897; Eng. tr. as *Miracles of Antichrist*, 1899). Commissioned in 1902 by the National Teachers' Association of Sweden to write a school textbook which should present in story form the folklore, geographical peculiarities, and flora and fauna of the various provinces of the country, Miss Lagerlöf accomplished her task with a success that added a children's classic to Swedish and world literature—*Nils Holgerssons underbara resa*, 2 vols. (1906-1907), the English translation of which is entitled *The Wonderful Adventures of Nils* (1907).

Honors followed Miss Lagerlöf's successes. In 1904 the Swedish Academy awarded her its gold medal; in 1907 she received the degree doctor of letters from Uppsala University; in 1909 she was awarded the Nobel Prize for literature, the first woman to have received this honor; and in 1914 the Swedish Academy elected her membership—again the first woman so honored. Her following in the United States is in part due to Mrs. Velma Swanston Howard, who faithfully translated many of her books.

Although Miss Lagerlöf was first greatly influenced by the works of Thomas Carlyle, she afterward found a warm and serene style of her own that flowed in a simple, story-telling manner from her pen. Her other works translated to English include *Invisible Links* (1894; Eng. tr. 1899); *The Queens of Kungahälla* (1899; Eng. tr. 1917); *From a Swedish Homestead*, a collection of short stories (1899; Eng. tr. 1901); *The Girl from the Marsh Croft* (1908; Eng. tr. 1910); *Further Adventures of Nils* (1911; Eng. tr. 1911); *The Emperor of Portugallia* (1914; Eng. tr. 1916); *The Outcast* (1919; Eng. tr. 1921); *Mårbacka: The Story of a Manor* (1922; Eng. tr. 1924); the trilogy *Löwensköldska ringen* (1925), *Charlotte Löwensköld* (1925), and *Anna Svard* (1928), Eng. tr. combined into *The Ring of the Löwenskölds* (1931); *Diary of Selma Lagerlöf* (1936; Eng. tr. 1937).

Bibliography.—Larsen, H. A., *Selma Lagerlöf* (New York 1936); Gustafson, A., *Six Scandinavian Novelists* (Princeton, N. J. 1940).

LAGO MAGGIORE. See **MAGGIORE LAKE**.

LAGOON, lä-gōon' (Lat. *lacuna*, a ditch, pool, or pond), a shallow lake or creek connected with the sea, found along low-lying coasts. It is also applied to the expanse of water in the interior of those coral reefs which present to view above the surface of the water nothing but an external fringe. See also **ATOLL**; **CORAL AND CORAL ISLANDS**.

LAGOS, lä'gòs (in full **LAGOS DE MORENA**), city, Mexico, in the northeast of the State of Jalisco, 45 miles northwest of Guanajuato, on the Mexican Central Railroad. It lies 6,000 feet above the sea and is the shipping center for an agricultural region. It has silver mining, shoe factories, and dairy industries, and is a resort center. It was founded about 1540, being named Santa Maria de los Lagos, and after the war of independence was named after its defender, Pedro Moreno, who died here in battle against the Spaniards in 1817. Pop. (1940) 12,490.

LAGOS, lä'güs, seaport, Nigeria, West Africa, the capital and seat of the central government of the British colony and protectorate of Nigeria. The most important seaport of Nigeria, it is situated on an island of the same name, at the west end of Lagos Lagoon, off the Gulf of Guinea. It is connected by the Carter Bridge, 2,500 feet long, to Iddo Island, which is connected to the mainland by another bridge, and there are direct rail and highway connections with Kano, 700 miles distant. The chief exports are rubber, cacao, peanuts, tin, hides and skins, gums, kerosine and palm oils, and mahogany. It is the site of two teachers' institutions, King's College and Queen's College.

The island was discovered and named by the Portuguese in the 15th century, and was a notorious slave market until the mid-19th century. Lagos and its hinterland were acquired by the British from the native king in 1861 after British troops had occupied the island for 10 years. It has since been administered as a part of Sierra Leone (1866-1874), part of the Gold Coast Colony (1874-1886), an independent protectorate (1886-1906), part of Southern Nigeria (1906-1914), and is now incorporated in the colony and protectorate of Nigeria, and is governed by a commissioner. Pop. (1950 est.) 230,000.

LAGOS, lä'gōosh (ancient **LACOBRYGA**), seaport commune, Portugal, in Faro District, Algarve Province, beautifully situated on the western shore of Lagos Bay on the Atlantic Ocean. It has several churches, an aqueduct, and a great stone bridge spanning an arm of the sea. It is a railroad terminus and has industries of wine and fruit growing, and tunny and sardine fisheries. It was once the favorite residence of Henry the Navigator and was almost completely ruined by an earthquake in 1755. On Aug. 18, 1759, a French fleet was defeated off Lagos by British forces under Adm. Edward Boscawen. Pop. (1940) 6,938.

LAGRANGE, là-gränzh', **Joseph Louis**, French mathematician: b. Turin, Jan. 25, 1736; d. Paris, April 10, 1813. His great-grandfather was a cavalry officer in the French Army, and later served Sardinia. When scarcely 19, La-

grange was made mathematical professor in the artillery school at Turin. In 1764 he obtained the prize of the Academy of Sciences in Paris for a treatise on the libration of the moon, and in 1776 for another on the theory of the satellites of Jupiter. About this time he made a visit to Paris, where he became personally acquainted with D'Alembert, Clairaut, Condorcet and other savants. Soon after his return he received an invitation from Frederick the Great to go to Berlin, with the title of Director of the Academy. Here he lived for 20 years, and wrote his great work 'La Mécanique analytique.' After Frederick's death (1786) the persuasion of Mirabeau and the offer of a pension induced him to settle in Paris. He was the first professor of geometry in the Polytechnic School, and the first inscribed member of the Institute. He took no active part in the Revolution, and the law for the banishment of foreigners was not put in force against him. In 1794 he was appointed professor in the newly-established Normal School (École Normale Supérieure) at Paris (1794), as well as in the École Polytechnique. Napoleon bestowed upon him distinguished tokens of his favor, and he became member of the Senate, grand officer of the Legion of Honor and count of the empire. The most important of his works are his 'Mécanique analytique' (1788); 'Théorie des fonctions analytiques' (1797); 'Résolution des équations numériques' (1798); 'Leçons sur le Calcul des fonctions'; and 'Essai d'arithmétique politique.'

LAGUERRE, la'gär, Edmond Nicolas, French mathematician: b. Bar-le-Duc 9 April 1834; d. there, 14 Aug. 1886. His abilities had been already acknowledged by the Lyceum when his article solving the mathematical problem of angular solution was published (1853) in *Nouvelles Annales de Mathématiques*, he entering the École Polytechnique the same year. In 1885 he was elected member of the Academy of Sciences to succeed Serret in the geometry section, and shortly afterward he was appointed to the chair of physical mathematics at the College of France. His algebraic system applied to curves and spherical measurements were a great advance in science. Most of his writings found publication in *Nouvelles Annales*, *Comptes Rendus* and *Bulletin de la Société Philomatiques*. Among those works published by him are 'Note-sur la resolution des équations numériques' (Paris 1880); 'Théorie des équations numériques' (Paris 1884); 'Recherches sur la géométrie de direction' (Paris 1885). Posthumous honors were accorded him in rewarding him with the Prix Petit d'Ormoy in 1887. Consult Poincaré, 'Notice sur Laguerre' (Paris 1887).

LAGUNA, la-goo'na, N. Mex., Indian pueblo in Valencia County; alt. 5,795 feet; 50m. W. of Albuquerque; on the Santa Fe Railroad. It is in the Laguna Indian Reservation, which covers more than 125,000 acres of grazing land and irrigated farming area and includes the Acoma pueblo. This is one of the largest and most modernized pueblos. The San Jose de Laguna Church dates from 1699, and is decorated with Indian designs; there are paintings on elk's skin. A harvest dance is held annually, in September. See PUEBLO INDIANS, and KERESAN; also ACOMA, ISLETA, and JEMEZ. Pop. (1940) 1,011.

LAGUNA, Philippines, a province of the island of Luzón, situated in the southern part of the island, on the south and east shores of the Bay Lagoon (q.v.); area, including dependent islands, 752 square miles. The province is mountainous in the centre and north, and in the southwest is Mount Maquilang, 3,666 feet high; there are a number of rivers; the soil is very fertile; the climate moist and variable. A great variety of tropical plants and trees found in the Philippines grow here; the staple products are sugar, rice, corn, cotton, tobacco, indigo, cocoanut, betel nut and fruit and vegetables. There are a number of industries, including mills for the extraction of cocoanut oil, furniture manufacture, the manufacture of cheese and stock raising; there is considerable export trade, products being sent to all parts of the archipelago. Civil government was established in the province in July 1902. The inhabitants are mostly Tagalogs. A railway runs along the south shore of the bay from Santa Cruz (the capital, q.v.) to Manila. Pop. 148,000.

LAHARPE, la arp, Jean François d, French critic and author: b. Paris, 20 Nov. 1739; d. there, 11 Feb. 1803. He first brought out several volumes of 'Héroïdes' but first gained note by his tragedy 'Warwick' (1763) though his other tragedies met with no success. But his 'Éloges' on Henry IV, Fénelon, Racine etc., show refinement and added to his fame but his conceit and harsh criticisms made him numerous bitter enemies, nearly losing him the election (20 June 1776) to the Academy. He gave lectures, as professor of literature at the newly founded Lycée (1786-98) with great success. His articles as critic for the *Mercur de France* brought applause, also those under the title 'Lycée ou Cours de littérature' (Paris 1799-1805). His participation in the Revolution brought him five months in jail in 1794, but he became an enemy of revolution later at an earnest worker for religion and monarchy. He supervised a selection of his works in six volumes (Paris 1778), and his 'Œuvres choisies et posthumes' appeared in four volumes. Consult Sainte-Beuve, 'Causeries du lundi' (5 vols. Paris, 1856); Edlich, 'Jean François de la Harpe als Kritiker der französischen Literatur im Zeitalter Ludwigs XIV' (Leipzig 1910); not, 'Recherches sur La Harpe' (Dijon 1820).

LAHEE, Henry Charles, American writer on musical topics: b. London, England, 2 July 1856. He was educated at Saint Michael's College, Tenbury, Worcestershire, where he was chorister (1865-69), and was in the English mercantile marine (1871-79). Coming to the United States he was secretary of the New England Conservatory of Music at Boston (1891-99), and since the last-named date has conducted the musical agency in Boston. He has published 'Famous Singers of Yesterday and To-day' (1898); 'Famous Violinists of Yesterday and To-day' (1899); 'Famous Pianists' (1900); 'Grand Opera in America' (1901); 'The Organ and its Masters' (1902); 'Grand Opera Singers of To-day' (1912); 'Annals of Music in America' (1923), and contributions to periodicals.

LAHN, län, Germany, a tributary of the Rhine having its source in the Rothaargebirge Westphalia. Its length is 135 miles and is navigable from the mouth up to Giessen by aid of locks. The valley, sometimes quite narrow,

row, is rich in natural beauties and much visited by sight-seers. Ems is the principal town on the river's banks.

LAHORE, lä-hör', India, second city and capital of the Punjab, on the left bank of the Ravi, 298 miles northwest of Delhi by rail. The native city covers an area of 640 acres, surrounded by a brick wall 30 feet high, flanked by bastions, and approached by 13 gates. The streets are extremely narrow, and the houses have in general a mean and gloomy appearance; but these only appear by contrast with the magnificent structures by which they are dominated. "On the northeast side especially the mosque of Aurangzeb, with its plain white marble domes and simple minarets, the mausoleum of Ranjit Singh, with its rounded roof and projecting balconies, and the desecrated façade of the Mogul palace, stand side by side in front of an open grassy plain, exhibiting a grand *coup d'œil*." The citadel or fort stands on a slight but commanding eminence. The European quarter and the Mean Meer cantonment (three miles distant) lie to the south and east. Among modern buildings are the Punjab University, the Oriental College, Aichison Chief's College, Mayo Hospital, Victoria Jubilee Hall, school of art, Anglican cathedral, etc. It was at one time a great centre of the decorative arts—gold and silver ware, glass and enamel work—but most of these have gradually declined or vanished, and was famous for its superb cloths made of Bokhara thread. The North-West Railway workshops employ 5,000 men; the other industries include soap, acids, printing, leather, cotton and woollens, furniture, bricks and tiles; and the city is the centre of a rich agricultural district. A municipality was organized in 1867, water supply was introduced in 1881 and a drainage system in 1883.

In 1524 Lahore became the seat of the Mogul Empire, under which it reached its greatest splendor. Before passing into the hands of the British it was the capital of the khans. Pop. about 429,000 (60 per cent Mohammedan). Lahore division (commissionership) has an area of 17,154 square miles, and population of 4,656,629. The Lahore district has an area of 3,704 square miles; pop. about 1,250,000.

LAHR, lär, Germany, town in the district of Offenburg, Baden, on the Schutter River, junction of the Dinglingen-Lahr State Railway and street railways. It has three Evangelical and one Catholic church, a monument to Bismarck and another to the poet Eichrodt. Among its other public buildings are a gymnasium, high school, trade school, Imperial orphan asylum and several government edifices. Among its manufactures are ovens, pottery, snuff and cigars, roof-paper, toys, frames, chicory, leather, artificial flowers, also book-binding and lithographic work and wine culture are done on a large scale. The town has been in existence since 1278 and was the principal town under the Geroldseck government, later belonging to Nassau, and (1497) coming under rule of Baden. Pop. 15,191.

LAIBACH, li'bäh, Slovenian *Ljubljana*, capital of the division of Carniola, Jugo-Slavia, situated on the Laibach River, which is spanned by seven bridges, and on the southern

branch of the Vienna-Trieste and the Laibach-Oberlaibach, and other railways. It is embellished with large squares, and the monument to Radetzki von Fernkorn, and beautiful promenades. Among its more important edifices are the Saint Nicholas Cathedral (18th century) with its high cupola and frescoes; the Saint Jacob's, and Evangelical churches, the latter in Byzantine style, Ursuline convent; government building, palace of justice, agricultural building, town-hall, bishop's palace, casino, etc. A monument was erected (1886) to Anastasius Grün. The industrial establishments include a cotton-goods factory, bell foundry, iron foundry, machine works, candy and chicory factories and manufactures of wire, paper, twine, stone and earthenware, leather, beer-brewery, electrical works, etc. Among her educational institutions are two Obergymnasias, a high school, teachers' institutes, a theological institute, trade school, commercial institute, students' library, museum and theatre. The museum contains interesting relics of a lacustrine village discovered in the Laibach fens. The Schlossberg towers high over the town and has a castle dating 1416–1520, partially destroyed (1813) by the French. The town is generally acknowledged to be the seat of the ancient Emona. In 1270 Ottokar of Bohemia captured the place, and it received municipal rights in 1416. After capitulation (1809) to the French it was occupied till 1813 as seat of the governor-general of the Illyrian provinces. The Congress of Monarchs met here to debate the situation of Italy which later brought about the overthrow of the liberal constitution of Naples, England being dissident. Consult Müllner, A., 'Emona' (Laibach 1879); Richter, 'Geschichte der Stadt Laibach bis 1461' (in Klum's 'Archiv für Geschichte Krains,' parts 2 and 3). Pop. 57,000.

LAILER, Harry Wellington, American socialist author: b. Brooklyn, N. Y., 18 Feb. 1884. He was educated at Wesleyan University A.B. (1907) and received the degree of LL.B. at Brooklyn Law School (1910), and of Ph.D., Columbia (1914). He was member of the reportorial staff of the *Brooklyn Eagle* (1907–10), a founder of the Intercollegiate Socialist Society (1905) and its secretary from 1910, an association on similar lines as the English Fabian Society. He was editor of the *Intercollegiate Socialist* (1913–19); of *Socialist Review* (1919–21); one of editors of *Labor Age* since 1921. He studied the labor question and social movements in Europe and here and has delivered numerous lectures on these subjects. He wrote 'Boycotts and the Labor Struggle' (1914); 'The Socialism of Our Times' (1929); etc.

LAING, läng, Alexander Gordon, British African explorer: b. Edinburgh, Scotland, 27 Dec. 1793; d. near Timbuctoo, Africa, 26 Sept. 1826. After serving for several years in the English army, he entered on his career as an African traveler in 1822. In that year he visited Falaba, the capital of the Sulima country, got to within three days' journey of the supposed source of the Niger, but had perforce to return. An opportunity having presented itself of proceeding on the discovery of the course of the Niger, it was arranged that he should accompany the caravan from Tripoli to Timbuctoo. He left Tripoli in July 1825 in com-

pany with the Sheik Babani, and after a tedious journey of nearly 1,000 miles arrived at Ghadames; and on 3 December reached Ensala. He quitted Ensala on 10 Jan. 1826 and on the 26th entered on the sandy desert of Tenezaroff. After some fighting with the Tuaregs he arrived at Timbuctoo on 18 August, the first European who had ever reached that city. After a short stay he set out on his return, but was assassinated on 26 Sept. 1826. The murder was committed by the order of the son of the Prime Minister of Tripoli, whose agent, Babani was. Laing's journals, which he had prepared for the press, were published in 1825 under the title, 'Travels in the Timmannee, Kooranko and Soolima, Countries of Western Africa.'

LAING, Gordon Jennings, American classical scholar: b. London, Ontario, 16 Oct. 1869. He was graduated (1891) at the University of Toronto, took the degree Ph.D. at Johns Hopkins (1896), then studied for a year at the American School of Classical Studies, at Rome. He was instructor of classics at Whetham College, Vancouver, British Columbia (1892-93); lectured on Greek and Latin (1893) at Toronto University, and on Latin literature (1897-99) at Bryn Mawr College. He was made professor at the University of Chicago (1913); dean of the Faculty of Arts McGill (1921-23), and then professor of Latin, and chairman of the department, University of Chicago. He was managing general editor of the University of Chicago (1908-21), and from 1923. He edited 'Masterpiece of Latin Literature'; 'Selections from Ovid'; 'Phormio of Terence.' He died at Chicago, Ill., Sept. 1, 1945.

LAING, Malcolm, Scottish historian: b. near Kirkwall, Orkney, 1762; d. there, 6 Nov. 1818. He was a lawyer by profession and later a member of Parliament, but devoted himself principally to historical investigation. He completed the last volume of Henry's 'History of Great Britain' (1785) and was the author of a 'History of Scotland' (1800), which may be regarded as supplementary to Robertson's history and is a monument of painstaking research. In the preliminary dissertation he presents an elaborate argument to prove Queen Mary's participation in the murder of Darnley. He published in 1805 an edition of Ossian.

LAING, Samuel, Scottish author: b. Kirkwall, Orkney, 4 Oct. 1780; d. Edinburgh, 23 April 1868. Entering the army in 1805 he served in the Peninsular War and in 1834 traveled in the Scandinavian countries. He published 'Journal of a Residence in Norway 1834-36' (1836); and 'A Tour in Sweden' (1839); 'Notes of a Traveller' (1842); but is best known by his important translation of the 'Heimskringla or Icelandic Chronicle of the Kings of Norway, with a Preliminary Dissertation' (1844).

LAING, Samuel, English railway administrator, politician and author: b. Edinburgh, 12 Dec. 1812; d. Sydenham Hills, Kent, 6 Aug. 1897. He is the son of Samuel Laing (1780-1868). He was prominently identified with railway legislation in England, the inception of "parliamentary" passenger trains with a fare of one penny a mile being due to his suggestion, and he was chairman of the Brighton and South Coast Railway. He was for many years

prominent in Parliament and from 1860 to 1863 held the office of Finance Minister in India. In his old age he took to writing books, mainly philosophical. Of his works, 'Modern Science and Modern Thought' (1885), and 'A Modern Zoroastrian' (1887), have occasioned some discussion. His other publications of a miscellaneous character include 'India and China' (1863); 'A Sporting Quixote; or the Life and Adventures of the Hon. Augustus Fitzmuddle' (1886); 'The Antiquity of Man' (1890); 'Human Origins' (1892).

LAIRD, Iärd, David, Canadian politician: b. New Glasgow, Prince Edward's Island, 1833; d. Ottawa, 12 Jan. 1914. He was educated at Truro, Nova Scotia, and subsequently established and edited the *Patriot* in Charlottetown. In 1871 he became a member of the assembly of Prince Edward Island and after the admission of the province to the Dominion was a member of the House of Commons and Minister of the Interior, 1873-76. He was lieutenant-governor of the Northwest Territory, 1876-81. In 1877 and 1899 he was a commissioner in the arranging of treaties which extinguished by purchase the Indian title to great tracts in the Qu'Appelle and Peace River districts.

LAIRD, John, English shipbuilder: b. Greenock, Scotland, 14 June 1805; d. Birkenhead, Cheshire, England, 29 Oct. 1874. His shipyards were at Birkenhead, on the other side of the Mersey from Liverpool, and he was for a long time the head of the firm of John Laird and Sons. He was the first builder of iron steamships and built the *John Randolph*, the *Nemesis* and the *Alabama*. The first was the earliest iron vessel that was ever seen in America and was sent out to Savannah in pieces; the second, the first armed vessel of iron. The history of the *Alabama* is well known. He entered Parliament for Birkenhead in 1861 when he retired from active business.

LAIRESSE, lä'rës', Gerard de, Dutch painter and etcher: b. Liège, Belgium, 1640; d. Amsterdam, 11 June 1711. He was early a pupil of his father, Regnier Lairesse, and of Flemmels, and left them for Utrecht, and afterward Amsterdam, where he labored hard for perfection in his art. He first of all confined himself to models of the antique and the classical ideals of Poussin. His work was thus distinguished by somewhat wearisome mannerism and his pictures very frequently seem painted in an unnatural silvery, metallic tone. His masterpieces are to be seen in Amsterdam, Schleissheim, Cassel and in the Louvre, Paris. His ideas on art, as dictated to his pupils and associates, together with his etchings, were published after his death in two volumes, under the title 'Het Groot Schilderboek' (1712). The work has been translated into German, French and English and has had a great influence in the art education of the 18th century.

LAIS, lä'is, the name of two Greek hetærae, celebrated for their remarkable beauty. The first lived at Corinth at the time of the Peloponnesian War; the most eminent and wealthy men of the time, including Aristippus, the Cyrenaic philosopher, and Diogenes, the cynic, fell under her spell. The younger Lais was the daughter of Timandra and was born

t Hyccara, Sicily, 422 B.C. She came to Corinth in her seventh year, and was educated in her profession by the painter Apelles. Later in life she followed a certain Hippostratus to Thessaly, where she was stoned to death by women in the temple of Aphrodite. But it is impossible to sift the really historic from mere anecdotal tradition in the accounts of these women which have come down to us. Consult Jacobs, 'Lais, die ältere und die jüngere' (1830); Wieland, 'Aristipp.'

LAISSEZ-FAIRE, lâ'sâ fâr'. A slogan of great potency in the political and economic discussions of the 18th century, particularly in France. It made a strong appeal to the jurists and to the philosophers of an age engrossed with the idea of a "natural law," which was higher than the edicts of kings and parliaments and was the only right rule of human conduct. The French lawyers from the earliest times showed a predilection for the *droit naturel* in their theoretical disquisitions; but in practice, strangely enough, they strenuously adhered to the medley of provincial *coutumes*, Roman jurisprudence and royal proscriptions, which constituted the laws of their country. It was the Marquis d'Arguesau who first injected the natural law into the domain of legislative polemics and made the phrase "laissez-faire" a postulate for political argument. "Laissez-faire," he declared, as early as 1735, should be the fundamental rule of government and should be adopted as its watchword by every public authority. "To govern better," he said, "it is necessary to govern less," a pronouncement which was to become the palladium of liberty with the Jeffersonian school of politics in America, and with individualists everywhere for a century and a half to come. But d'Arguesau, probably, got his catchword from Colbert, who records the fact that in 1680 a merchant, Legendre by name, on being asked what was required for the advancement of commerce and industry, replied: "Laissez-faire"—leave them alone. What was meant was that the production and exchange of commodities should be relieved of the restrictive regulations and taxes with which they were burdened. Not only was international commerce hampered by export and import duties, of which few persons of those times would have thought to make complaint, but domestic trade was impeded by equally great, if not greater, obstacles. Every road was barred by gates at which toll had to be paid to the king or provincial seigneur and every commune exacted octroi and other charges on everything that was brought in from other communes or the surrounding country. License fees were exacted from every calling and many industries were monopolized for the revenue they yielded to the state.

These were the conditions against which the "Physiocrats"—the elder Mirabeau, Mercier de la Riviere, Turgot and, above all, François Quesnay launched their protest. Quesnay, a philosopher and surgeon of note, and physician to Madame Pompadour, made the phrase "laissez-faire" the groundwork of his system of economics. He contributed a number of articles to the 'Encyclopedie' of Diderot, wherein his theory of free trade was fully developed. The free exercise of his faculties, he declared,

is every man's natural right as long as in the exercise of this right the similar rights of all other men are respected by him. Starting with this as a postulate, Quesnay deduced as a corollary, the right of every man to the undisturbed enjoyment of the fruits of his handiwork or intellectual activity. The free enjoyment thereof included the right to freely dispose of or exchange the commodities and other things of value thus produced. Any tax or other regulation imposed by public authority, which hinder such production, enjoyment or exchange, are invasions of natural right. The proper functions of government are, the protection of life and property and the administration of justice, and the assumption of greater or other powers is supererogation. "Laissez faire, laissez passer," let men make things and let the products pass. This is natural law in an economic dress. As a by-product of his theorizing Quesnay evolved the *impôt unique*, or single tax. Agriculture, he declared, stands apart from other industries in that it alone yields a *net*. All other industries involve merely a change of materials in form and position; he, therefore, calls them "barren." But agriculture produces a "surplus value." The productiveness of agricultural land varies; but the rental value automatically fixes the relative capacity of any given piece of land to yield a *net* or surplus. Let taxation, therefore, be limited to ground rent. Incidentally this would prevent the friction which is caused by the shifting of taxation; a tax in the form of rent could not be shifted. The *impôt unique*, of course, implied the abolition of customs duties, transit dues and all other taxes on industry and commerce. Adam Smith made the law of supply and demand, operating without restriction in a free market, the basis of his economic system. Jeremy Bentham adopted the reasoning of Quesnay with respect to the functions of the state, saying that political economy requires nothing from the latter but the security of industry from governmental interference. In other respects Bentham was not in sympathy with the theory of "natural law." Indeed his pronouncements, that the state is the source of all law and that legislation should have regard for "the greatest good of the greatest number," are, in the main, negations of the doctrine of "laissez-faire." The phrase, however, obtained currency in England, and more (one-sided) honor there than in the land of its origin. "Laissez-faire" became the shibboleth of the free traders of the Manchester school, and of the orthodox political economy everywhere. Carlyle launched his invectives against the "dismal science" in vain. "Supply and demand and the devil take the hindmost" was his energetic translation of the phrase into English. But the policy of "hands-off" or "laissez-faire" remained a fixed principle in English legislation until quite recent times, particularly with respect to the taxation of the rental value of, or potential surplus product from, land. Public opinion, and scientific opinion as well, has undergone a complete change. The extreme individualism, which supplied most of the axioms of politics and law down to the last quarter of the 19th century, and a long way into that period in some countries, has given way nearly everywhere

Aidful, protective and regulative intervention in industrial affairs is being more and more completely recognized as a legitimate governmental function. The greatest good to the greatest number, rather than natural right and the greatest possible liberty of the individual, has become the active principle of modern legislation.

STEPHEN PFEIL.

LAJARD, là'zhār, Jean Baptiste Félix, French archaeologist: b. Lyon, March 30, 1783; d. Tours, September 1858. While attached to the Persian mission he collected the valuable series of ancient Babylonian cylinders now located in the Bibliothèque Nationale. He studied the close connection of the Greek civilization with the Orient and the origin of the Hellenic religions. He also served in various diplomatic capacities in Greece, Russia, and Denmark. He was a member of the Académie des Inscriptions and was author among other works of *Recherches sur le culte public de Mithra en Orient et en Occident* (Paris 1867).

LAJARTE, Théodore Edouard Dufaure de, French author on music: b. Bordeaux, July 10, 1826; d. Paris, June 20, 1890. He studied at the Paris Conservatory and wrote many small operettas but was best known for his works on music history. He served as sub-librarian at the Paris Opéra and catalogued the operas produced there in his work *Bibliothèque musicale du théâtre de l'Opéra* (1876-1879). He also edited various collections of music.

LAJOIE, lāsh'ō-wā, Napoleon (known as LARRY LAJOIE), American professional baseball player: b. Woonsocket, Rhode Island, Sept. 5, 1875. He played second base in the National League with Philadelphia (1896-1900) and was in the American League with Philadelphia (1901; 1915-1916) and Cleveland (1902-1914). He was the American League batting champion in 1901, 1903, and 1904, and had an average of .338. He is a member of the Baseball Hall of Fame.

LA JOLLA, là hō'yā; hoi'ā, section of San Diego, California. It is the location of Scripps Institution of Oceanography, and the sea-washed caves attract many visitors yearly.

LA JONQUIERE, là zhōn'kyār', MARQUIS DE (JACQUES PIERRE TAFFANE), French naval officer: b. Lagrassies, near Albi, about 1686; d. Quebec, Canada, March 17, 1752 (some authorities give his dates as 1680-1753). He participated in the taking of Rio de Janeiro (1711), the Battle of Toulon (1744), and commanded the French fleet at the Battle of Finisterre (1747). Taken prisoner, he gained his liberty on the Treaty of Aix-la-Chapelle when (1749) he went to Quebec as governor of Canada.

LAJPAT RAI, Lala, Indian nationalist and social reformer: b. Jagron, Punjab, 1865; d. Lahore, Nov. 17, 1928. After taking a law degree in 1885 at the Punjab University, Lahore, he commenced practice at Hissar. He returned to Lahore to practice, and there became an active member of the Indian National Congress. As a consequence of his part in inciting unrest among members of an agricultural settlement in 1907, he was deported to Mandalay, Burma, without trial, but as a result of protests made in the

House of Commons he was shortly returned to India. During 1921-1923 he was interned to sedition; and in 1928 he carried a measure in the Legislative Assembly for boycott of the Indian statutory commission headed by Sir John Simon. While resident in the United States during World War I, he wrote *The Arya Samaj* (1915), *Young India* (1917), and *National Education in India* (1920); in reply to Katharine Mayo's *Mother India*, he wrote *Unhappy India* (1928).

LA JUNTA, là hūn'tā, city, Colorado, Otero County seat; altitude 4,050 feet; 63 miles south east of Pueblo; on the Arkansas River; served by the Atchison, Topeka and Santa Fe Railroad; with a municipal airport and airline service. It has large railroad shops and processes the meat and dairy products from neighboring stockraising and dairy-farming lands. The Bent's Fort Museum (erected in commemoration of Old Fort Bent) maintains a Kit Carson collection. La Junta was settled in 1863, incorporated as a town in 1881, and as a city in 1901. It has a city manager form of government. Pop. (1940) 7,040; (1950) 7,679.

LAKANAL, là-kā-nāl', Joseph, French statesman: b. Serres, July 14, 1762; d. Paris, Feb. 14, 1845. He was educated by the Doctrinaires, joined their congregation and became a teacher, then professor in philosophy at Moulins. He was sent to the National Convention (1792) as deputy for his department and voted for the unconditional death of Louis XVI. He rose to the presidency of the Committee of Public Instruction in 1793. He took a prominent part in the creation of the École Normale, Institute, central schools, primary schools and in the adoption of telegraphy. He entered the Council of Five Hundred and held various educational posts. In 1816 he was banished as a regicide and emigrated to the United States where he became president of the University of Louisiana (1817-1825). On the establishment of the consulate he returned to France in 1834.

LAKE, Gerard, 1st Viscount LAKE, British army officer: b. July 27, 1744; d. London, Feb. 20, 1808. He became an ensign in the foot guards in 1758, and during 1760-1762 saw active service in Germany. In 1781 he was in North America, commanding a battalion in the campaign which terminated with the surrender of General Cornwallis at Yorktown, and during 1793-1794 he commanded a brigade in the Low Countries. Appointed commander in chief of the troops in Ireland in 1798, he routed the rebels at Vinegar Hill and forced their French allies to surrender at Ballinamuck. In 1801 he arrived in Calcutta to assume command of the British force in India. With outbreak of the war against the Marathas in 1803, he captured Delhi and Aggra and won a crushing victory at Laswari. At Farrukhabad-cum-Fategarh, in 1804, he again defeated the Marathas, and for this success was created a baron. The next year he pursued Holkar, the Maratha leader, into the Punjab and forced him to surrender at Amritsar. He returned to Britain in 1806, and in 1807 he received the thanks of Parliament and a viscounty.

LAKE, Kirsopp, English theologian: Southampton, April 7, 1872; d. South Pasadena, Calif., Nov. 10, 1946. He graduated in theology

at Lincoln College, Oxford, in 1895, was ordained in the Church of England, and appointed curate at Lumley, Durham. In 1897 he returned to Oxford as curate of Saint Mary the Virgin, and in 1904 he was appointed professor of theology at Leiden. He went to Harvard University in 1914 to become professor of early Christian literature, and five years later he was made Winn professor of ecclesiastical history; in 1932 he was appointed professor of history at Harvard, a chair which he continued to occupy until his retirement in 1938. He organized the expedition which excavated Samaria between 1929 and 1934, and that which excavated at Van during 1938-1939. His numerous writings included *The Historical Evidence for the Resurrection of Jesus Christ* (1907); *The Early Days of Monasticism on Mount Athos* (1909); *Landmarks in Early Christian History* (1920); *Religion Yesterday and To-morrow* (1925); *The Beginnings of Christianity*, 5 vols. (1920-1932).

LAKE, Simon, American naval architect and mechanical engineer; b. Pleasantville, N. J., Sept. 4, 1866; d. Bridgeport, Conn., June 3, 1945. He invented the even-keel type of submarine torpedo boat and in 1897 built the *Argonaut*, the first submarine to operate successfully in the open sea. He spent several years in Russia, England, and Germany in an advisory capacity on the construction of torpedo boats. He also invented the apparatus for locating sunken vessels.

LAKE (Latin *Lacus*), a considerable inland body of still water either salt or fresh.

Lakes are natural reservoirs collecting in depressions which are formed in the following ways: (1) where rising ridges cut off an arm of the sea such as Lake Nicaragua, once a gulf of the Pacific; (2) where surface strata subside like Eyre in Australia, or are dissolved like the limestone lakes of Florida; (3) river erosion which deepened if it did not create the basins of the Great Lakes; (4) the rending of global strata like the Great Rift Valley of Africa which produced abysmal Tanganyika and Nyasa; (5) glacial action which has gouged out innumerable lake beds or obstructed mountain valleys with moraine; (6) volcanic action where lava has dammed up exit valleys like Lake Kivu in Africa, or exposed bowl-like dead craters; (7) mere swellings in a river channel like Geneva, an enlargement of the River Rhone; (8) minor agencies such as vegetation, beaver dams, or depressions made by enormous meteors.

Lakes are fed (1) by rivers which nevertheless tend to destroy them by depositing silt and cutting down the outlet level, or (2) are catch basins of local rains and snows, or (3) are fed from springs or merely expose the underground water table.

Global distribution is most unequal. Nearly half the world's lakes are in Canada. Florida boasts 30 thousand. Fresh lakes abound in Finland and Scandinavia; salt lakes in Turkestan.

Lakes range in altitude from the Dead Sea 1,292 feet below sea level to the sky lakes of the Himalayan region more than 16,000 feet above. They vary in depth from mud-choked Lake Chad in Africa to Asia's cavernous Baikal which recent surveys give a maximum depth of over 5,700 feet. The largest lake in the world is the Caspian Sea, 169,300 square miles. Among fresh water lakes Superior leads in area, 31,820 square miles, but

Baikal is the most capacious, for it could swallow all five of the Great Lakes and, indeed, engulf the Baltic Sea.

Every lake is either losing or accumulating mineral content. Russian Lake Onego, one of the freshest of all lakes, was once an arm of the Arctic Ocean, while Great Salt Lake, a dwindled remnant of fresh Lake Bonneville, is now seven times saltier than the Atlantic.

Lakes are transient landscape features. They degenerate first into swamps then into meadows. It is predicted that half the lakes in Minnesota will dry up within fifty years. Even Superior is a relic of a much larger lake. Among dying lakes are the playas of South America and Australia, dust spots except during periodic rains. There are unnumbered dead lakes. Death Valley merely exposes the bed of former Lake Manly.

Every large lake is a miniature world of specialized flora and fauna. Baikal abounds in species found nowhere else. Some forms suggest the weird denizens of the abysmal sea. Lakes have also developed definite cultures as recorded in the prehistoric villages of the Swiss lake dwellers. Salt lakes are the source of useful minerals; fresh lakes of water and fish. Lakes are notable avenues of commerce, favorite vacation areas, and often of great beauty like Lake Louise in Canada or Como in Italy.

Large lakes influence climate. The orchard belt of Ontario extends but a few miles from water. Even small lakes are welcome humidors in arid regions.

The oldest of artificial lakes was mysterious Moeris which impounded the overflow of the Nile. More ambitious are projects in the valleys of the Tennessee, the Columbia, and the Missouri rivers. Lake Meade, formed when the Colorado backed up behind Hoover Dam, has one-twelfth the volume of Lake Erie. For, having destroyed innumerable lakes and thus imperiled vital water resources, mankind is now creating new ones.

FERDINAND C. LANE.

LAKE. The term lake is broadly used to refer to colored pigments containing organic compounds. In the strictest sense a lake is made up of metallic hydrous oxides, of which alumina is typical, on the surface of which a dye is adsorbed. This phenomenon is analogous to the application of dyes to inert fibers, and the colors are singularly fast and permanent. Some lakes are mechanical mixtures made by simple grinding together of highly colored and colorless materials. Insoluble dyes made up of sulfonates of colored compounds; of metallic compounds in which the metal is linked to such elements as nitrogen by secondary valences; and of carbon compounds containing no metal but insoluble in water and oil are all known more correctly as toners, although often called lakes. Lakes are used in paints and printing inks. When colored substances are applied to cloth previously treated with metallic compounds from which hydrous oxides are formed, the same sort of adsorption takes place, but the product formed on the cloth is not called a lake, and the operation is known as dyeing with a "mordant."

LAKE CHAMPLAIN, Battle of. See CHAMPLAIN, LAKE, BATTLE OF.

LAKE CHARLES, city, Louisiana, Calcasieu Parish seat; altitude 20 feet; situated on

the Calcasieu River; 237 miles west of New Orleans and 150 miles east of Houston; and is a port of entry of the 21st customs district. The Calcasieu river, lake, and pass provide a channel with minimum depth of 30 feet from the city to the Gulf of Mexico. Lake Charles is served by the Kansas City Southern, the Missouri Pacific, and the Southern Pacific railroads; and is on a federal highway. The city is the center of a rich agricultural region producing rice and cattle. In its early years, lumbering was its principal industry, but other manufactures have developed, such as petroleum and petroleum equipment, chemical products, concrete pipe, and synthetic rubber. There is still a pine and hardwood timber industry. Lake Charles adopted commission government in 1913. The first permanent settlement on this site was made in 1852. Lake Charles was incorporated in 1857, and chartered as a city in 1886. It is the seat of a state trade school and of a state college. Lake Charles has a Carnegie library service. Pop. (1950) 41,202.

LAKE CITY, city, Florida, Columbia County seat; altitude 200 feet; 59 miles west of Jacksonville; on the Seaboard Air Line, the Atlantic Coast Line, and the Georgia Southern and Florida railroads. It is in an agricultural area raising tobacco, corn, peanuts, cotton, melons, and vegetables, with trade in lumber and naval stores. The headquarters for the Osceola National Forest is located here. The city was first called Alligator after the chief of a nearby Seminole Indian village. It was incorporated in 1859. Pop. (1940) 5,836; (1950) 7,469.

LAKE CITY, city, Minnesota, Wabasha County; altitude 690 feet; 31 miles northeast of Rochester; on Lake Pepin, which is navigable and connects with the Mississippi River; on the Chicago, Milwaukee, St. Paul and Pacific Railroad. It is situated in an agricultural and dairying region. The chief industries are flour milling, wholesale nurseries, creameries, and foundries. Lake City has a Carnegie library and a historical society museum. The government is by mayor and council; water system is owned by the city. Pop. (1940) 3,204; (1950) 3,450.

LAKE CITY, city, South Carolina, in Florence County; altitude 70 feet; 22 miles south of Florence; on the Atlantic Coast Line railway. It produces stock, poultry, and has many truck farms. Pop. (1940) 2,522; (1950) 5,097.

LAKE DWELLINGS, dwelling houses of men built on piles in the water near the shore of a lake. They may be considered in two categories: the prehistoric structures of Switzerland and the neighboring region; and the more modern structures elsewhere.

Swiss Lake Dwellings.—Villages constructed by men of the Neolithic and subsequent ages of culture in the water of the lakes of northwestern Switzerland, and in adjoining parts of France and Italy. They do not represent an epoch in itself, but only incidents of situations with reference to the social conditions of their time. It may be supposed that the desire for safety was the ruling motive in constructing homes surrounded by water. Nothing more is known of these villages than may be gathered from a study of their remains. They are found in all the larger lakes as well as in some small ones—perhaps 300

sites in Switzerland and many others in Italy. The first discovery was in Lake Zurich in 1856 when a season of extremely low water disclosed groups of stumps of piles at a little distance from the shore; and dredging recovered hundreds of implements of stone, bone, and deer-horn, that had been lying in the mud for thousands of years. Subsequent exploration of the submerged margin of other Swiss lakes showed many more town sites, and exhumed a vast quantity of relics, in some cases only those of the Stone Age, in other metallic implements denoting occupation in the Age of Bronze, while a very few sites showed an intermediate condition of culture. The custom of making these lacustrine villages continued therefore, from the time of the Neolithic people—probably from their first advent—on through the Bronze Age and into the more modern time when iron had come into use. The occupation of these villages, however, was far from continuous. At Robenhhausen, on the ancient Lake of Pfäfers, now a dry marsh, three Neolithic occupations appear, one on top of the other, and each was destroyed before the next began. The tops of each set of piles are from three to five feet higher than the earlier set. The number of houses in the first occupation has never been estimated; that of the second has been estimated at 30, and the third and last at 50 houses. The settlements covered nearly three acres and contained about 100,000 piles. At Morges, on Lake Geneva again, three different stations close together evidently belong to different times. One has yielded no metal; the second a mixture of stone and the straight, flat, bronze hatchets characteristic of the beginning of the Bronze period; the third only the finest of advanced bronzework. It is probable that these successive occupations represent as many catastrophes, most likely overwhelming conquests in which the places were sacked and swept away by fire. Evidence of conflagration is frequently noticed. In such a case decay and ice would gradually dispose of the piles near the surface of the water, but where it was deep, or the timbers were sunk in mud they would be preserved. A complete dugout canoe has been found in one place. Burned towns might frequently have been rebuilt, but finally all were abandoned, and new towns arose nearby in subsequent centuries. Some of the more recent villages were of comparatively great size. That at Morges was 1,200 feet long by 150 broad, and is estimated to have housed 1,200 inhabitants. Much study has been given to the plan and construction of these lacustrine habitations. Although in some of the little lakes foundations of bundles of withes, or of heaps of stones, were made, as in building crannogs, most villages rested on thousands of piles. The labor involved must have been prodigious, especially in the Stone Age, when trees had to be felled and cleared of limbs, and piles sharpened, with only stone hatchets and fire for tools. The necessary number of piles having been driven into the bottom of the lake, their tops were cut to a general level and then floored with planking or slabs, on which the buildings were erected. A narrow bridge, perhaps with a draw, connected the platform with the shore. What the houses and other superstructures were like is a matter of doubt. They must have been fairly substantial and tight to withstand the winter cold and mountain gales, and no doubt contained fireplaces of stones and clay for warmth and cooking purposes. It

probable that they were usually formed of reeds or slender poles covering the frame, and coated with clay, forming wattle-and-daub huts, as fragments of such clay walls, hardened by fire, have been found in abundance.

Other Lake Dwellers.—Antiquarians and travelers have described similar dwellings, and even villages still in use in various parts of the world. Herodotus, who visited Thrace early in the 5th century B.C., saw the natives about Lake Prasias living in a lacustrine village precisely like those of ancient Switzerland; modern Rumelian fishermen around Lake Prasias still build and inhabit similar dwellings. The same customs followed by tribes dwelling on marshes, lake borders or river courses in central Africa, the East Indies and Malaya, Australasia and in tropical America. The motives nowadays are not always, if ever, fear of enemies, but rather convenience, since such folks are usually dependent on boats for travel, or are engaged in fisheries of some sort, or find it necessary to sleep above the wet jungle soil, and out of the way of dangerous animals and annoying vermin. One of the most prominent examples is that which led European explorers to give the name Venezuela ("Little Venice") to the northern coast of South America. Around Lake Maracaibo the Indians dwelt in the rainy season in flimsy shelters perched on piles driven in the water, the shorter ones carrying the sills and floor, and the longer ones the roof-poles. They made platforms for storing property, and little islands as refuges for their meager livestock. But there is a well-known example nearer home. The Irish, and to some extent the Scottish and English of old times, had lake dwellings that were made in the following way and were styled crannogs.

Crannogs.—Great quantities of small stems, reeds and the like are collected and sunk by means of stones in the lake, so as to form an island. Very often advantage is taken of the presence of an island just level with the surface of the water, which can be raised a foot or two above the surface with comparatively little labor. Sometimes a few upright piles are driven in on top after the chief part of the island has been raised in the manner described. When the island thus raised to a sufficient height it is frequently strengthened by an enclosure of stakes driven to the bottom of the lake perpendicularly. A platform of thin stems of trees, either round or split into boards, is then made on top of the island, and this supports the structures that are built on them. The crannogs of Ireland appear to have been used as strongholds rather than as dwellings.

G., *Lake Dwellings of Ireland* (Dublin 1886); and Munro, R., *Lake Dwellings of Europe* (London 1890).

ERNEST INGERSOLL.

LAKE ERIE, Battle of. See ERIE, LAKE, BATTLE OF.

LAKE FOREST, city, Illinois, in Lake Michigan; altitude 704 feet; on Lake Michigan; 28 miles north of Chicago; on the Chicago and North Western, and the Chicago North Shore and Milwaukee railroads. This is a North Shore residential suburb, with no industries. It is the site of Lake Forest College and of Barat College.

College of the Sacred Heart (Roman Catholic). Founded in 1857, it was chartered as a city in 1861. It has mayor and council, with a business manager. Pop. (1950) 7,694.

LAKE FOREST COLLEGE, at Lake Forest, Illinois, is an accredited coeducational institution. Originally chartered as Lind University in 1857 the name was changed in 1865 to Lake Forest University. Affiliations with various other schools were discontinued in 1902 at which time the name became Lake Forest College. In 1925 the college sold Ferry Hall (a girls' preparatory school opened in 1869) and Lake Forest Academy (a boys' preparatory school opened in 1858); each is now privately maintained by separate boards of trustees. The bachelor of arts degree is granted in arts and business administration and the degree of bachelor of science is given in the nursing school. Student enrollment in 1950 was 997.

LAKE GENEVA, city, Wisconsin, in Walworth County; altitude 890 feet; on the Chicago and North Western Railroad; by rail, 71 miles northwest of Chicago. The city, located on the shore of Lake Geneva, is a popular resort. The Yerkes Observatory, operated by the University of Chicago, is located here. The surrounding area is agricultural. The municipality was first incorporated as a village in 1833. Its government is administered by mayor and council. The water supply system is municipally owned. Pop. (1940) 3,238; (1950) 4,279.

LAKE GEORGE, village, New York, in Warren County; on the southern tip of Lake George; 40 miles northeast of Amsterdam; on the Delaware and Hudson Railroad. It is of importance as a summer resort. Pop. (1940) 803; (1950) 1,005. See also GEORGE, LAKE.

LAKE OF THE WOODS, a boundary lake, partly in the province of Ontario, Canada, and partly within the state of Minnesota, and with a small part in Manitoba, 190 miles northwest of Lake Superior and 377 feet above its level. It is broken by one long promontory and several smaller ones into distinct portions, of which only the southern, containing Big Island, is properly designated the Lake of the Woods, while the eastern bears the name of Whitefish Bay, the northern, which is studded with islands, being called Clearwater Bay, and the northwestern, Shoal Lake. The whole expanse of water forms a single lake of very irregular shape about 65 miles in length and from 10 to 60 miles in breadth, the water area having a total of about 1,851 square miles of which 466 square miles are in the United States. It is navigable for vessels, drawing not more than nine feet of water. Rainy River, the principal feeder of the lake, enters it at its southeastern extremity, just below Fort Louise; its discharge is at the north by the Winnipeg. It abounds with sturgeon. The boundary between Canada and the United States follows the Rainy River to its mouth in the lake, and then proceeds across the lake in such a way as to leave Big Island to Canada, while giving most of the Lake of the Woods proper to Minnesota. A little west of the meridian of 95° the boundary strikes due south to meet the parallel of 49°, which is then followed, the result being that the United States owns an isolated portion

of the land on the northwest shore. See also **BOUNDARIES OF THE UNITED STATES.**

LAKE PLACID, village, New York, in Essex County; altitude 1,740 feet; 40 miles southwest of Plattsburg; on the New York Central Railroad. A resort town, it is situated in the heart of the Adirondack Mountains on Mirror Lake, near the southern end of Lake Placid. It was founded in 1850 and incorporated in 1900. An Olympic Arena built in 1932 was the scene of the Third Winter Olympic Games in 1932. Nearby is Mt. Marcy (5,344 feet), the highest in New York State; and Whiteface Mountain (4,872 feet), accessible by automobile over the Whiteface Mountain Memorial Highway. A few miles from the town is the farm and grave of John Brown of Osawatimie. Pop. (1940) 3,136; (1950) 2,981.

LAKE PROVIDENCE, town, Louisiana, seat of East Carroll Parish; near the Mississippi River; on the Missouri Pacific Railroad; about 60 miles northeast of Monroe. It is a cotton and farm area and was settled about 1812; incorporated in 1876. It was earlier known as Stock Island when it served as a refuge from pirates. Pop. (1940) 3,711; (1950) 4,119.

LAKE SCHOOL OF POETS. The terms "Lake School of Poets" and "Lake Poets" are used in English literature to designate the three poet friends—William Wordsworth, Samuel Taylor Coleridge, and Robert Southey—who were residents of the Lake country of northern England. Wordsworth, the school's acknowledged leader, announced its iconoclastic theories in the revised and enlarged second edition of his *Lyrical Ballads*, called the 1800 edition, though not published before January 1801; but the term "Lake School" seems not to have become current until 16 years later when the brilliant essayist and critic William Hazlitt used it in an invidious sense, his former friendship with the three poets having in the interim changed to hostility.

Reviewing Coleridge's *Biographia Literaria; or Biographical Sketches of My Literary Life and Opinions* in the August 1817 issue of *The Edinburgh Review*, Hazlitt—apropos of Coleridge's "copious discussion of the merits of his friend Mr. Wordsworth's poetry—which we do not think very remarkable either for clearness or candour"—crushingly comments that, "though we shall endeavour to give due weight to Mr. C.'s reasonings when we have occasion to consider any new publication of the Lake school, we must for the present decline any notice of the particular he has here urged to our former judgments on their productions . . ." No doubt it was one of Coleridge's dicta on Wordsworth that gave Hazlitt the idea of the "school." To quote Hazlitt again: "The learned author indeed judiciously observes that Mr. Wordsworth would never have been 'idly and absurdly' considered as 'the founder of a school in poetry,' if he had not, by some strange mistake, announced the fact himself in his preface to the *Lyrical Ballads*."

Apparently the *Edinburgh's* editor Francis Jeffrey, who added a footnote of nearly five-page length consisting in the main of a defense against certain charges made against himself and Hazlitt, liked the "school" notion; for in another brief footnote he mentions "the Pantisocratic or Lake school," thus alluding as well to the project

of a pantisocratic society which in 1794 the 22-year-old Coleridge of Jesus College, Cambridge on a visit to Oxford had hatched with his new-found friend, 20-year-old Robert Southey of Balliol. If that early intimacy of the two young romantics had no consequence of a communist colony in the United States, it did result in Coleridge's first acquaintance with his future wife Sarah Fricker, sister of Southey's fiancée Edith.

That Hazlitt in 1817 regarded the middle-aged Southey both as man and author with no less contempt than he felt for the brother-in-law is suggested by his unflattering characterization of Southey in this most scathing of reviews as "a mere bookworm, shut up in his study, and too attentive to his literary duty to mind what is passing about him. He has no humour. His wit is at once scholastic and vulgar. As to general principles of any sort, we see no trace of any thing like them in any of his writings. He shows the same contempt for abstract reasoning that Mr. Coleridge has for 'history and particular facts.'"

What were the principles of the Lake Poets? To comprehend them one must hark back to the first intimacy of Wordsworth and Coleridge in the summer of 1797 when young Coleridge with his wife and child was living in a cottage at Nether Stowey, learning potato culture and preaching on Sundays at the Unitarian chapels of Bridgewater and Taunton. Having formed an acquaintance with William Wordsworth and his sister Dorothy the previous autumn, Coleridge visited them in June 1797 at Racedown in Dorsetshire where they lived in a house lent to them by a friend. The Wordsworths were deeply interested in poetic experiment, and William read to their visitor a drama in blank verse, *The Borderers*. Coleridge thought it "absolutely wonderful," comparing it to Schiller and Shakespeare. His hosts were equally enthusiastic about their guest's tragedy *Osorio*, written for Drury Lane at Sheridan's request, but destined not to be performed there until 1813. A month later the Wordsworths moved to a house called Alfoxede in West Somerset, not far from Coleridge's cottage.

The poets were now living in such close neighborhood that their friendship had opportunity to ripen. "On these delicious hills, sight of the yellow Bristol Channel," observed Edmund Gosse in *A Short History of Modern English Literature*, "English poetry was begun again during the autumn months of 1797, in endless walks and talks of the three enthusiasts—three, since Dorothy Wordsworth, though wrote not, was a sharer, if not an originator, all these audacities and inspirations."

First fruits of their collaboration was little volume of *Lyrical Ballads, with a few other Poems*, appearing in September 1798. It was published anonymously at Bristol with no title that it represented the work of more than one poet. Actually it included four contributions of Coleridge: *The Rime of the Ancient Mariner*, in *Seven Parts* (title and text were considerably altered in the second edition of 1800); *The Foster-Mother's Tale*; *The Nightingale's Conversation Poem*; and *The Dungeon*. Wordsworth contributed such poems as *Goody Blake and Harry Gill*, *The Thorn*, and *The Idiot Boy*, in which some reviewers conceded merit. Southey alone finding worthy of note the subsequently famous *Lines written a Few Miles*.

Rintern Abbey in which the poet made a statement of his literary creed. It was Wordsworth's primary aim to destroy the artificial conventions of the poets of the day who held to the traditional belief that both subject and diction must be "poetic" in the sense of remoteness from the simple natural things of life. A few days after the publication the Wordsworths and Coleridge left England on a tour of Germany. Mrs. Coleridge, left at home, wrote them cheerfully that "the *Lyrical Ballads* are not liked at all by my," which was indeed only a slight exaggeration.

To the enlarged second edition of 1800 Coleridge added only one poem, *Love*. It is this edition which is memorable for Wordsworth's famous preface of nearly 50 pages—an essay on the poetic art, so finely critical and so beautifully expressed that it does not suffer in comparison with the exquisite prose of a Shelley. Here at last was the creed for the new poets, an affirmation that poetry cannot and must not be divorced from life, that "the passions of men should be incorporated with the beautiful and permanent forms of nature."

At this time Wordsworth, a native of Cumberland and born at Cockermouth on the outskirts of the Lake district, returned to his loved home-country. For the next half century, until his death on April 23, 1850, he lived almost without intermission at Grasmere (1800–1813) and Rydal Mount (1813–1850). Marrying in 1802, he accepted the laureateship after Southey's death in 1843. He and his wife are buried in the churchyard at Grasmere, and nearby is the tomb of Hartley Coleridge, Samuel Taylor's poet son, who lived many years in the Lake country at Keswick, Ambleside and Grasmere. Coleridge himself lived for some time at Keswick and was often a guest of the Wordsworths at Grasmere. Southey lived at Keswick for last forty years of his life. Though poet reate (1813), it must be conceded that he is far from being a poet of the first rank, as he, unquestionably, his fellow-poets of the Lake school. Indeed, Southey would probably be forgotten today were it not for his association with Wordsworth and Coleridge and his prose masterpiece, *The Life of Nelson*, for which he received only £300. Andrew Lang remarks of him sadly, "His long and noble life of industry led in 1843; for some time he had sat in the library which he had made without the power to read his books."

The Lake district was not the discovery of the Lake school. Thomas Gray loved it a generation before and wrote a journal of his tour of the Lakes in 1769 containing many striking descriptions of its romantic scenery. Sir Walter Scott was entranced by that wild border region, the scene of many of his novels and poems. But in the early 19th century the Lake district has become a Mecca for lovers of literature, artists and scholars primarily because of its associations with the immortal poetry of Wordsworth and Coleridge.

Campbell (London 1907); Gosse, Edmund, *A Short History of Modern Literature* (New York 1905); Lang, Andrew, *History of English Literature from "Beowulf" to "The Waste Land"* (London and New York 1912).

DRAKE DE KAY,

Staff Editor, *Encyclopedia Americana*.

LAKE SUCCESS, village, New York, in Nassau County, about 4 miles northwest of Mineola. It was settled by the English in 1644 who purchased land from the earlier Dutch settlers. During the American Revolution, British troops were quartered here, and later, in 1800, frightened Negro slaves were detained here but freed in 1820. The Sperry Corporation plant, built in 1941, became the temporary home of the United Nations from 1947 until the completion of the Manhattan building late in 1950. The name, Lake Success, was taken from an Algonquian Indian chief, Sacut. Geologically, the lake resulted from the disintegration of a glacier during the Ice Age; it is more than 80 feet in depth, being fed by springs, and has no outlet; a connecting lake is known as Lake Surprise. The town was incorporated in 1927 with the purpose of protecting property owners by zoning and to end the many excursionists. Government is by mayor and a board of trustees. Pop. (1940) 203; (1950) 1,255.

LAKE WALES, city, Florida, in Polk County; altitude 150 feet; 25 miles southeast of Lakeland; on the Seaboard Air Line, and the Atlantic Coast Line railroads. Lake Wales is a winter resort in a lake and citrus fruit region, and is near the Mountain Lake Sanctuary with its Singing Tower, generally called Bok Tower. The city was incorporated in 1917 and has a mayor and council. Pop. (1950) 6,802.

LAKE WORTH, city, Florida, in Palm Beach County; altitude 20 feet; 6 miles south of West Palm Beach; served by the Florida East Coast and the Seaboard Air Line railroads, and a federal highway. Primarily a residential and winter-resort town, it extends along both shores of Lake Worth, and is in a truck-farm, dairy, and poultry area. There are nurseries here and manufactures include salt shakers and fishing tackle. The municipality owns a golf course, Casino (bathhouses), the electric light and water plants, also ice and cold-storage plants. Settled in the 1870's, and laid out in 1912, it was incorporated the following year. Government is by mayor and council. Pop. (1950) 11,714.

LAKEHURST, borough, New Jersey, in Ocean County; on the Central of New Jersey Railroad. Since the town lacks important industrial plants or agricultural products, the primary interest is in the Lakehurst Naval Air Station established there in 1919 as a base for lighter-than-air craft. From here the *Shenandoah*, the first American rigid airship, made its first flight in 1923; the *Graf Zeppelin* began and finished its 21-day around-the-world trip in 1929; and here the *Hindenburg* was destroyed by fire May 6, 1937. Pop. (1940) 827; (1950) 1,492.

LAKELAND, city, Florida, in Polk County; altitude 205 feet; 32 miles east of Tampa; on the Atlantic Coast Line Railroad, on a federal highway, and served by an airport. The city is a popular winter resort, situated in a citrus, strawberry, vegetable, and cattle-raising area, and has pebble phosphate mines. There are numerous lakes, a civic center built around Mirror Lake in the heart of the city, and a library. The Florida Southern College is located here. Lakeland was incorporated in 1885, and has a city manager and commission. Pop. (1950) 30,846.

LAKEMBA, là-kēm'bà, the chief island of an island group by the same name, in the Pacific Ocean, at the southern end of the Lau group of the Fiji Islands. A volcanic island of about 5 miles in breadth, the highest point is Mt. Good-enough. Interior land is poor, but coastal areas are rich. First missionaries settled here in 1835. Lakemba was a meeting place for Fijians and Tongans.

LAKEWOOD, village, New Jersey, township in Ocean County; altitude 80 feet; on the south branch of the Metedeconk River; 59 miles southwest of New York City, and served by the Central of New Jersey Railroad. Lakewood is a famous health and winter resort, situated in a pine forest region. It is built around two attractive lakes, the Manetta, and the Carasaljo, and is especially noted for its dry and stimulating climate. The Georgian Court College for girls, and the Newman School for boys are here. Five miles away is the Lakewood United States Naval Air Station. A considerable portion of the residential part of Lakewood was destroyed by forest fires in April 1941. The government is by a township committee. Pop. (1950) 10,736.

LAKEWOOD, city, Ohio, in Cuyahoga County; altitude 685 feet; on Lake Erie; 5 miles west of Cleveland; served by the New York, Chicago, and Saint Louis Railroad. It was settled in 1808 as East Rockport but renamed in 1889; incorporated in 1911. Government is by mayor and council. Pop. (1950) 67,878.

LAKHIMPUR, lūk'hēm-pōor, town, Republic of India, in the state of Assam some 300 miles northeast of Shillong. It is almost on the Tibetan frontier, near the right bank of the Subansiri, a tributary of the Brahmaputra River. Under the previous British administration it was the headquarters of a fertile district in which there are numerous extensive tea gardens. Coal fields and petroleum deposits in the Makum area of the district of Lakhimpur are being exploited.

LAKI, Mount, volcano, Iceland, more than 100 craters extending southwest of Vatnajökull were created by the eruption of 1783, one of the greatest and most destructive volcanic outbreaks in Icelandic history.

LAKME, lāk'mā, a beautiful tragic opera in an Indian setting, composed by Léo Delibes, libretto by Philippe Gille and Edmund Goudinet based on a poem by the latter, *Le Mariage de Loti*; first produced in Paris on April 14, 1883. Delibes, a contemporary of Richard Wagner, was uninfluenced by the German music of his era as a result of the Franco-Prussian War. The plot, laid in 19th century India, begins with Lakmé, a Hindu maiden, who falls in love with Gerald, an English officer. Her father, Nilakantha, a fanatical Brahmin priest, stabs Gerald, but the girl with the help of a slave conveys the officer to a hut in the forest and nurses him back to health. Gerald is recalled to his sense of duty by a brother officer. Reading the resolve in his face that he means to leave her, Lakmé eats a poisonous flower and dies in his arms.

LAKSHMI, lūk'shmē, in Hinduism, the goddess of beauty and wealth, the wife of Vishnu. She is the female or productive energy of Vishnu,

and hence is in many cases regarded as an expression of the attributes of Vishnu. She is said to have been produced from the ocean of milk when churned by the gods to obtain the beverage of immortality. She was thus born in the full flush of beauty, adorned with a diadem and with gems on her neck and arms, bearing in her hand a lotus. As soon as she was born she betook herself to the bosom of Vishnu, to whom she was ever faithful. According to a later view, that of the worshippers of Vishnu, this god produced three goddesses, Brāhmi, Lakshmi and Chandikā, the first his creative, the second his preserving and the third his destroying energy. See SRI.

LA LAGUNA, lä-lä-gōon'nä, commune, Spain, in Santa Cruz de Tenerife Province. It was the former capital and former seat of the University of San Fernando. Manufactures include tiles, tobacco, brandy, and leather. Pop. (1941 est.) 33,042.

LALANDE, lä-länd', Désiré Alfred, French-English musician: b. Paris, Dec. 5, 1860, d. London, Nov. 8, 1904. A distinguished oboe player, he had studied at the Paris Conservatory. In 1886 he went to England where he played with several famous orchestras, Hallé, Manchester, Scottish, and the Queen's Hall, until his death resulting from pneumonia.

LALANDE, Jean (SAINT JEAN LALANDE), French Jesuit missionary in Canada: d. near Auriesville, New York, 1646. He came to America in 1644 and accompanied Father Isaac Jogues two years later to the Mohawk Indians where both were martyred.

LALANDE, Joseph Jérôme Le Français de, French astronomer: b. Bourg-en-Bresse, Am, July 11, 1732; d. Paris, April 4, 1807. He devoted himself to mathematics and astronomy and was sent by the Academy in 1751 to Berlin to determine the parallax of the moon, while Nicolas Louis de Lacaille went with the same object to the Cape of Good Hope. After having finished his operations at Berlin, he was chosen member of the Academy of Sciences in Paris in the year 1753. Thenceforward no volume of their *Transactions* appeared which did not contain some important communication from him. In 1762 he was appointed professor of astronomy in the Collège de France, where he lectured with great success to the end of his life, and in 1795 was appointed director of the Paris Observatory. His chief works are his *Traité d'astronomie* (1764); and *Bibliographie astronomique* (1803). He wrote all the astronomical articles for the great *Encyclopédie* and contributed to various scientific periodicals, besides editing the *Connaissance des temps*.

LALANDE, Michel Richard de, French organist and composer: b. Paris, Dec. 15, 1657; d. Versailles, June 18, 1726. After becoming a self-taught violinist, bass violist, and harpsichordist, he studied the organ and became organist for three Parisian churches. He was named by Louis XIV as music teacher for the princesses and in 1683 was appointed master of the royal chamber music. He composed many motets and among other works *Ballet de la jeunesse* (1686). *L'Amour fléchi par la Constance* (1697); and *Les Folies de Cardenio* (1721).

LALEMENT, läl-män, **Gabriel**, French Jesuit missionary: b. Paris, 10 Oct. 1610; d. in the Huron country, 17 March 1649. He became a Jesuit in 1630, arrived in Canada in 1646 and in 1648 was sent to the Huron missions under de Brébeuf. He was there about a month when the Iroquois attacked the settlement of Saint Ignatius and later attacked the Saint Louis mission, where they captured de Brébeuf and Lalement. They led the two priests to Saint Ignatius, there tied them to stakes and after horrible torture put them to death. Consult Martin, 'Hurons et Iroquois.'

LALEMENT, Jérôme, French Jesuit missionary in America: b. Paris, 27 April 1593; l. Quebec, 26 Jan. 1673. In 1610 he entered the Jesuit order, then taught in educational institutions of the order, and in 1638-45 was superior of Huron Jesuit mission in New France. In 1645-50 he was superior of all the missions in New France. After a sojourn in France (1650-59), he returned to America to resume his post. Letters and reports by him on the missions for 1639-43, 1646-48 and 1660-64 appear in the great compilation of the 'Jesuit Relations' (1896-1901). Consult also Parkman, 'The Jesuits in North America' (new ed., 1898).

LALIN, la-lên, Spain, town in the province of Pontevedra, located in a mountainous region, 37 miles northeast of Pontevedra. Its industrial life depends largely on the agriculture of the highlands, and it has tanneries and paper mills. Pop. 16,300.

LALITA-VISTARA, lă-lī-tā-vīs'ta-ra, one of the most celebrated works of Buddhistic literature, of unknown origin and antiquity, existing only in a Sanskrit version. It contains a narrative of the life and doctrine of the Buddha Sakyamuni, and is considered by the Buddhists as one of their chief works treating of religious law.

LALLA ROOKH, läl'a rook. This collection of narrative poems on Oriental themes (published 1817) brought Moore £3,000 before Longman, the publisher, ever saw the manuscript, and in popularity justified that price. Its permanent reputation, however, is almost solely that of a curiosity. Moore attempted an Oriental subject upon Byron's suggestion, and following Byron centred the interest of his narrative in love and freedom, but had, like Southey, to rely upon books, referred to in learned-looking notes, for his Eastern color. His framework story of an Indian princess traveling to meet the prince, her betrothed, and entertained along the way by the prince himself in disguise telling stories, has charm, but the stories themselves are strained in feeling, over-decorated, diffuse. The best of them, 'The Veiled Prophet,' approaches Byron's picturesqueness; 'Paradise and the Peri' has the lyric sweetness of Moore's own 'Melodies.' The references to the cause of Irish freedom are unconvincing and irrelevant. Of romantic over-sentimentality, with due observance of propriety, 'Lalla Rookh' contained an abundance sufficient to win the favor of a generation that liked the sentimentality in Scott and Byron; of real passion it contained about as much as a wedding-cake. One is now chiefly interested in the rallery of the prose passages making fun of contemporary critics. The best

judges of Moore's own day did not overrate the merit of his performance, and Hazlitt, who said that the author had mistaken the art of poetry for that of cosmetics, assessed its faults justly if with characteristic emphasis.

WILLIAM HALLER.

LALLEMAND, la'l-män', **Charles François Antoine**, BARON, French general: b. Metz, 23 June 1774; d. Paris, 9 March 1839. A volunteer of 1792, he became an aide-de-camp of Junot and gained the grade of colonel by his conduct at Jena. In Spain he was advanced (1811) to brigadier-general and took an important part under Davout (1813-14) at the defense of Hamburg. Given command (1815) by Louis XVIII of the department of the Aisne, he attempted, unsuccessfully, to create a rising in favor of Napoleon, who named him general of a division and peer of France. With Napoleon's surrender and deportation to Saint Helena, he desired to accompany the emperor but was forbidden. After several months internment at Malta, he was released, and after traveling to the East and to Egypt without finding employment, he sailed (1816) for America at the head of a number of other refugees who had been condemned to death by the ordinance of the 24th July. Meeting his brother here, they started to found a colony in the name of Champ d'Asile in Texas but encountered trouble with the Spaniards and he abandoned his plans. He had plans for releasing Napoleon, who left him 100,000 francs in his will (1821), but he is next heard of in Spain offering his services to the Constitutional party; he next went to Brussels and to Paris (in spite of the death sentence) and finally to New York, where he directed an educational establishment. Re-entering France after the revolution of July he was reinvested (1831) with his titles and made a peer of France (1832), commanding successively the 17th and the 10th military divisions.

LALLY-TOLLENDAL, lä-lë-tö-lön-däl, **Thomas Arthur**, COMTE DE: b. Romans, Dauphine, 1702; d. 9 May 1766. He was of Irish parentage, his father having followed the fortunes of James II. Trained to arms, he was made brigadier on the field of Fontenoy for distinguished bravery. He accompanied the Pretender to Scotland in 1745, and in 1756 was selected to restore the French influence in India, for which purpose he was made governor of Pondicherry. He failed in this, surrendered Pondicherry in 1761 and was brought prisoner to England. The following month he was allowed to return to France, where, after a long imprisonment, he was condemned and executed (1766) for treachery, etc. His son (Trophime Gerard, 1751-1830), supported by Voltaire, obtained in 1778 a complete authoritative vindication of his father's conduct. Consult Malleson, 'Count Lally' (1865).

LALO, la-lö, **Edouard Victor Antoine**, French composer: b. Lille, 27 Jan. 1823; d. Paris, 22 April 1892. He was a pupil, under Baumann, at the Lille branch of the Paris Conservatory, becoming first known at Paris as the violinist in Armingaud's chamber-music soirées, soon issuing his own chamber-music pieces. His opera 'Fiesco' (1867) was never presented but the ball-music was played in concerts (1872). His first full success arrived with

his grand opera play, 'Le roi d'Ys' (1876), his third opera, 'La Jacquerie,' was not finished till (1896) brought to completion by Coquard. His grand ballet, 'Namouna,' was included in the grand opera (1882), then in concerts, and his pantomime, 'Nero,' was played in 1891. As composer of instrumental pieces he was more fortunate, showing warmth and talent. He wrote three violin-concertos: the first dedicated to Sarasate, the second, 'Symphonie espagnole,' and the third, 'Concerto russe'; also a cello-concerto, piano-concerto, a 'Rhapsodie norvégienne' for the orchestra, a symphony, etc.

LAMA, genus *Camelida* including all the South American camel family represented by the species vicuña, guanaco, llama and alpaca. The two former are wild and the others domesticated races. O. Thomas decided the relationship of the domestic to the wild races as being derived from the wild guanaco. They are all smaller in size and build than the camels and have no hump on their backs. Their pointed ears are relatively longer than the camels, their tails a mere stump, toes separated each with its pad. There is a tooth less than the camels on each side of the upper jaw. They live in western and southern regions of South America in temperate climate, as the higher ranges of the Andes and Cordilleras, in Patagonia, Tierra-del-Fuego, etc. See LLAMA; ALPACA; VICUÑA.

LAMAISM, lä'ma-iz'm, the name usually given in the Occident to the form of Buddhism which is the prevailing religion in Tibet and in parts of central Asia. The word is derived from the Tibetan *Lama*, "Superior One," a term properly applied to the higher clergy, though often given by courtesy to all fully ordained monks. Buddhism was first introduced into Tibet in the 7th century A.D., during the reign of King Srong-tsan Gam-po, who married two Buddhist princesses, the one from Nepal and the other from China; but the religion made little headway until King Thi-srong De-tsan about 750 A.D. caused it to be preached throughout his dominions by an Indian teacher named Padmasambhava. This remarkable man, who is famous in Tibet for his supposed magical powers, succeeded in converting most of the people from their former religion, an animistic belief known as "Bon," but only by incorporating much of its demonolatry into the already corrupt form of Buddhism that he taught. At this time the order of monks, or Lamas, was established, monasteries were built, and the translation of the sacred books from Sanskrit into Tibetan was actively carried on. After an ineffectual persecution by King Lang Darma in the 9th century, which led to the ruin of the reigning dynasty, Buddhism soon regained its sway and the authority of the monastic order increased. In the 11th century Atisha, a monk from India, tried to reform some of the abuses then prevalent and to spread a purer theology, an effort which gave rise to the sectarian divisions of Lamaism. The Sa-kya sect was especially favored by Kublai Khan, the Mongol emperor of China in the 13th century, who recognized its Grand Lama's spiritual and temporal supremacy over Tibet. Another reformer arose in the person of Tsong-kha-pa (1355-1417), who revived the strict monastic discipline and founded the Ge-

lug-pa or "Virtuous Method" sect, often known as the "Yellow-hat" sect, from the color of its headdress, that of the other sects being red. Its third Grand Lama converted the inhabitants of Mongolia, and received from one of their chieftains the title of Dalai ("ocean-wide" or "all-embracing") Lama, by which his successors have generally been known to Europeans. The fifth Grand Lama of the Ge-lug-pa, named Ngag-wang Lo-zang Gya-ts'o, gained the temporal power over Tibet with Mongol aid about 1640, and began the building of the great palace-monastery of Potala near Lhasa, the capital. In the following century the Chinese government asserted its suzerainty over Tibet, and it has since then kept the Dalai Lamas subject to its political control, without, however, diminishing their ecclesiastical prestige in Tibet and Mongolia. At the present day Lamaists are also found in Manchuria, among the Buriat tribes in Siberia, the Kirghiz, and the Kalmuks on the Volga. In the south the inhabitants of the Himalayan districts of Ladakh and Bhutan and, in part, of Sikkim and Nepal belong to one or another of the Lamaist sects. The total number of the adherents of the religion is perhaps 10,000,000.

Beliefs.—The Buddhism which Padmasambhava brought to Tibet was that of the Mahāyāna school (see MAHAYANA), to which the mystical rites and theories of the Tantra (qv) had already been added. The doctrinal peculiarities of Lamaism are to be found mainly in its luxuriant mythology and demonology, derived partly from Hindu and partly from Tibetan sources. Beside and indeed outranking the historic Gautama or Sakyamuni are the figures of the divine "meditative" Buddhas (usually five) with their active celestial emanations, called Bodhisattvas, and their appearances on earth as human Buddhas in the present world cycle, Gautama himself being the most recent of these. A "primordial Buddha," or first cause, is also recognized. Especial reverence is accorded to the Bodhisattva Avalokiteśvara, "the all-seeing, merciful Lord," who is the offspring of Amitābha Buddha and the heavenly counterpart of Gautama, to Manjuśrī, the god of wisdom, and to the fierce Vairapāni. There are corresponding female Bodhisattvas or goddesses, of whom Tārā in her various forms is most worshipped. The foregoing deities, together with others, mostly of fiendish aspect, serve as "tutelaries," and both the various sects and each individual Lama have their respective patrons. Another highly revered class of demons is that of the "Defenders of the Faith," and there are many inferior spirits, friendly or malignant. Famous religious teachers, both Indian and Tibetan, have been canonized and are worshipped as incarnations of the deities.

Hierarchy.—The monastic order, which though an essential part of Buddhism, was loosely organized in earlier times, has become in Lamaism a highly developed system controlling the entire religious life of the community. The monks or Lamas are very numerous, and usually live together in monasteries although some are hermits and others are found in the villages of the laity. The rule of celibacy is strictly observed only by the Yellow-hat sect. Communities of nuns also exist, though they are few and less highly regarded.

order has four regular grades, probationer, novice, fully ordained monk and abbot; but above these stand the "reincarnate" Lamas, who are supposed to be the earthly manifestations of deities or of deceased saints. The Dalai Lama himself is regarded as the incarnation of Avalokiteśvara, his scarcely less revered colleague, the head of the monastery of Tashi-lhunpo, known as the Pan-ch'en Lama, as that of Amitābha, and the other chief Lamas of Tibet, Mongolia and elsewhere, over a hundred in number, claim similar origins. The mode of succession to these dignities, as practised for the last 500 years, is a peculiar one. The spirit of the deceased Lama is supposed to become reincarnate after a few weeks or sometimes a longer interval in an infant of marvelous birth and character. Search is made for children possessing such qualifications, and after preliminary tests the names are drawn by lot, under the supervision of other chief Lamas, and the new Lama is thus found. Sometimes, especially in Mongolia, the succession is restricted to members of particular tribes or even families.

Ritual.—The Lamaist system is highly sacerdotal, and the ceremonies of worship are carried on by the monks, who have in their monasteries temples richly adorned and containing many images. The analogy between the rites of Lamaism and those of the Roman Catholic Church has often been noticed, but Christian influence, though possible, has not been definitely proved, since Lamaist ritual may well be a natural development from the tenets of Mahāyāna Buddhism. Public worship consists usually of prayers, hymns and the presentation of cakes, rice, water and other offerings to the Buddhas and the other gods. Sacred sentences, the best known of which is the *om mani padme hūm*, or "Jewel-lotus" formula, are repeated in private devotion with the aid of a rosary or, when printed on paper together with mystic diagrams, are inserted in the well-known praying wheels or used as flags. Sorcery and magic are in high repute, even among the members of the reformed Yellow-hat sect, who possess an official oracle, and astrologers are often consulted. There are many religious festivals, the greatest being the feast of the conception of Gautama Buddha in the first month (February), the commemoration of his death in the fourth month, the water festival in the autumn and the festival of Saint Tsongkha-pa in the 10th month. A great mystery-play is enacted toward the close of the year.

General Influence.—While Lamaism in its distinctive features and as it is found in ordinary practice presents itself to the Occidental mind as a form of polytheistic superstition in which the propitiation of fiendish powers is a chief element, the ethical side of early Buddhism and its teachings have an ameliorating influence upon the more enlightened among the people, especially the clergy.

Literature.—The sacred books of Lamaism are the Canon proper, called the 'Kah-gyur' or 'Kanjur,' which is divided into 100 or sometimes 108 bulky volumes, and the Commentaries, the 'Tan-gyur' or 'Tanjur,' containing 225 volumes. The former consists mainly of translations from the Sanskrit of the scriptures of the Mahāyāna school, and of works on the Tantra system, together with a

few translations from the Pāli and the Chinese; the latter form a huge collection of theological, exegetical and scientific works partly of Indian and partly of Tibetan origin. Consult analysis of the 'Kanjur' made by Csoma Körösi, as translated and augmented by L. Feer in *Annales du Musée Guimet* (Vol. II, pp. 131-573, 1881); Ellam, J. E., 'Religion of Tibet' (1927); Grünwedel, A., 'Mythologie des Buddhismus in Tibet und der Mongolei' (1900); Köppen, C. F., 'Die lamaische Hierarchie und Kirche' (1859); Schlagintweit, E., 'Buddhism in Tibet' (1863); Schuleman, G., 'Die Geschichte der Dalailamas' (1911); Waddell, L. A., 'The Buddhism of Tibet' (1895).

CHARLES J. OGDEN.

LAMAMIAO, China, a town in southeast Mongolia known to natives as Dolonnor. It is in the jurisdiction of the province Tchili and is located on the western slopes of the Chingan Range at an altitude of about 4,000 feet. It has an earthen wall, narrow, unclean streets and two large monasteries. Its inhabitants number about 30,000 and it is a large commercial emporium trading with eastern Mongolia, Chinese bartering tobacco, saddles, tents, jewelry and arms against cattle, horses and sheep. It is noted for its skilled workers in clocks, bronze and cast iron idols, bells and vases, known all over China.

LAMANSKY, Vladimir Ivanovitch, Russian philologist and historian: b. Saint Petersburg, 1833. He was professor of Slavic languages at the Saint Petersburg University from 1865 to 1890, and belongs to the most enthusiastic and, at the same time, most learned representatives of the Slavophile movement in Russia. He wrote 'The Slavs in Asia Minor, Africa and Spain' (1859); 'Serbia and the Southern Slav Provinces of Austria' (1864); 'Historical Study of the Greco-Slavic World' (Saint Petersburg 1871), in which he advanced his theory of the contrast between the Greco-Slavic and the Romano-Germanic world. He wrote works also on the language and literature of the Bulgarians (1869); the literary monuments of the ancient Czechs (1879). In 1884 and later he issued 'Secrets d'État de Venise,' concerning 15th and 16th century documents in the archives of Venice, and (1892) the work 'The Three Worlds of the Asiatic-European Continent.' From 1890 editor of the ethnographic periodical *Zivaja Starina*. Deceased.

LAMAR, lā-mār', or **LAMAR Y CORTEZAR**, lā-mār' ē kōr-tā-thār', José, Spanish-American general: b. Cuenca, Ecuador, 1778; d. San José, Costa Rica, 11 Oct. 1830. He went to Spain in his youth, and entering the army there fought against the French at Saragossa. He was ordered to Peru in 1815, and was governor of Callao Castle at the time of its surrender, 21 Sept. 1821. He then joined the revolutionists and in 1824 became marshal. He was elected President of Peru in 1827; caused the deposition of Sucre, President of Bolivia; provoked a war with Colombia, in which he was defeated, and on 29 June 1829 was deposed by his own officers and exiled.

LAMAR, lā-mār, Lucius Quintus Cincinnatus, American jurist: b. Eatonton, Putnam County, Ga., 1 Sept. 1825; d. Macon, Ga., 23 Jan. 1893. He was graduated from Emory Col-

lege (Oxford, Ga.), studied law at Macon, was admitted to the bar in 1847, removed in 1849 to Oxford, Miss., was there professor of mathematics in the University of Mississippi (1850-1852), in 1852-1855 practiced at Covington, Ga., was elected to the Georgia legislature in 1853, and having returned in 1855 to Mississippi, was there elected representative in Congress in 1857 and 1859. In 1860 he resigned his seat in Congress; drafted Mississippi's ordinance of secession; and was a member of the State convention that passed it (Jan. 9, 1861). Chosen lieutenant colonel of the first Confederate regiment organized in Mississippi, serving with his regiment at Yorktown and Williamsburg, he resigned from military service in October 1862, and in 1863-1864 was in Europe, whither he had gone as commissioner to Russia, though he did not proceed to his post. From December 1864, until the close of the war, he was judge advocate of the military court of the 3d Army Corps with the rank of colonel.

After the war he held the chairs of ethics and metaphysics (1866-1867) and of law (1867-1870) in the University of Mississippi; he resigned when the Republicans secured control of the university upon the readmission of the state into the Union.

He was a representative in Congress (1873-1877) and a United States senator (1877-1885); and secretary of the interior in President Cleveland's cabinet (1885-1888). From 1888 he was an associate justice of the United States Supreme Court.

LAMAR, là-mär', **Mirabeau Buonaparte**, American politician, second president of the republic of Texas: b. Louisville, Ga., Aug. 16, 1798; d. Richmond, Tex., Dec. 19, 1859. After being employed a number of years in mercantile business and farming, he established in 1828 the *Columbus Inquirer*, a journal devoted to the defense of State rights, and was actively engaged in politics until his removal in 1835 to Texas. Arriving there at the outbreak of the revolution, he at once sided with the party in favor of independence, and participated in the Battle of San Jacinto, to the successful issue of which the charge of the cavalry under his command greatly contributed. He was soon after called into the cabinet as attorney general, a position which he subsequently exchanged for that of secretary of war. In 1836 he was elected the first vice-president of Texas, having for some months previous held the rank of major general in the army. In 1838 he was elected president, in which office he remained until 1841.

During his term of office Texas was formally recognized as an independent republic by the principal powers of Europe. He founded the educational system, advocating the grant of three leagues of land to each county for the maintenance of an academy and 50 leagues for two universities. Upon the breaking out of war between Mexico and the United States in 1846, he joined General Taylor at Matamoras, and fought at the Battle of Monterey. He subsequently stationed himself with an armed force at Laredo, where for two years he was engaged in constant conflicts with the Comanches, whose depredations on the frontier he greatly curtailed. He was appointed United States minister to Argentina in 1857, but did not go to his post. The last position which he held was that of

United States minister to Nicaragua and Costa Rica. He published *Verse Memorials* (1857).

LAMAR, city, Colorado, in Prowers County, on the Arkansas River, 120 miles east of Pueblo; altitude 3,615 above sea level. It is served by the main line of the Atchison, Topeka and Santa Fe Railroad.

Lamar is the trading center of a productive agricultural and livestock area which includes southeastern Colorado, western Kansas, and northwestern Oklahoma. Agricultural products include corn, wheat, barley, oats, sorghum, and safflower. The city has a large flour mill and a large alfalfa dehydrating and milling plant.

The government is the mayor-city-council type. Pop. (1950) 6,829.

LAMAR, city, Missouri, and Barton County seat; altitude 980 feet; 40 miles northeast of Joplin on the Missouri Pacific and St. Louis San Francisco railroads.

It is a fertile agricultural region and has important trade in wheat, corn, and poultry products. Its manufactures include power lawnmowers, brooms, and wire products. It is one of the largest prairie hay markets in the United States.

First settled in 1856, the city was named for Mirabeau B. Lamar (q.v.), president of the Texas Republic (1838-1841). Lamar is the birthplace of Harry S. Truman, 32nd president of the United States. Pop. (1950) 3,233.

LAMARCK, là-märk', **CHEVALIER DE** (JEAN BAPTISTE PIERRE ANTOINE DE MONET), French scientist, a pre-Darwinian evolutionist: b. Bazentin, Picardy, Aug. 1, 1744; d. Paris, Dec. 18, 1829. He was of noble family, entered the army in 1760, but was compelled on account of an accident to abandon active military service, after which he devoted his attention to study, first to medicine; afterward, after hearing Antoine de Jussieu's illustrations of botany, he turned to the study of that science. Jussieu had intimated that the old method of classification in botany was defective and Lamarck determined to remedy the deficiency. He labored with great diligence on a treatise in which he showed the defects of the old classification, and proposed a new one which met with general approval. He then applied his new system to the plants of France, and delivered to the French Academy his *Flore Française*, which brought him celebrity and secured his admission to the Academy of Sciences. This work was printed on the recommendation of the Academy, at the expense of the government, for the benefit of the author (1780).

Lamarck now turned his whole attention to botanical research, and made several excursions to Auvergne, and into Germany, in the last of which he was accompanied by the son of Buffon. On his return to Paris he undertook the botanical department of the encyclopaedia which Panckoucke was publishing, and applied himself to this task with such assiduity that, in 1783, he produced the first half of the first volume, with an introduction containing a sketch of the history of the science. He published the second volume in 1788. But a dispute between him and the publisher brought the undertaking to a stand, and ended Lamarck's botanical career. At the breaking out of the Revolution

He was the second professor of the royal Jardins Plantes, but in consequence of new arrangements he received a chair in the department of zoology, in which he was soon as much distinguished as he had been in botany. In his writings he shows himself a real forerunner of Darwin. Lamarck's comprehensive mind was also directed toward physics, on which he published several works. He published also a report annually on meteorology and weather predictions. His 'Hydrogéologie' was published in 1802.

Lamarck is the founder of invertebrate paleontology. The most permanently important work of his is 'Philosophie Zoologique' (1809), although at the time it was published it excited little attention. He was doubtless familiar with Erasmus Darwin's 'Loves of the Plants,' which in spite of its many absurdities contained some premonitions of the great discoveries to be made by the author's greater grandson, Charles Darwin. The essence of Lamarck's theory may be stated in the following propositions: (1) Every considerable and sustained change in the conditions of life produces a real change in the needs of the animals involved; (2) change of needs involves new habits; (3) altered function evokes change of structure, for parts formerly less used become with increased exercise more highly developed, other organs in default of use deteriorate and finally disappear, while new parts gradually arise in the organism by its own efforts from within (*efforts de son sentiment intérieur*); (4) gains or losses due to use or disuse are transmitted from parents to offspring. The main point is of course contained in the last proposition, which is controverted by Darwin and Weismann and their adherents in England and Germany. There is, however, a Lamarckian school of considerable influence in Paris, and the Neo-Lamarckians of the United States, including Cope, Hyatt and Packard, have much to support their "laws of growth" as involving the inherited effects of use, disuse and new environments. See DARWIN; EVOLUTION; HEREDITY.

Consult Butler, 'Evolution, New and Old' (1879); Claus, 'Lamarck als Begründer der Descendenztheorie' (1888); Cox, 'The Founder of the Evolution Theory' (in 'New York Academy of Science Annals,' Vol. XIX, 1910); Haeckel, 'Die Naturanschauung von Darwin, Goethe und Lamarck' (1882); Martins, 'Un Naturaliste philosophe' (Paris 1873).

LAMARCKISM, la-mär'kizm. The theory of organic evolution which, in brief, accounts for the origin of life-forms by change of environment, the exercise or use, and the disuse of organs, and the transmission of characteristics acquired during the lifetime of the individual. It differs from Darwinism in lacking the principle of natural selection.

History of the Rise of the Theory.—Lamarck, in 1801, after 25 years' experience as a botanist, and when as a systematic zoologist he had devoted 10 years of labor in classifying the invertebrate animals of the Paris Museum, then the most extensive zoological collection in the world, published a lecture, delivered in 1800, in which he claimed that time without limit and favorable conditions of life are the two principal means or factors in the production of plants and animals. Under the head of favorable conditions he enumerates variations

in climate, temperature, change of habits, variation in means of living, of preservation of life, of means of defense, and varying modes of reproduction. As the result of the action of these different agencies or factors, the faculties of animals, developed and strengthened by use, become diversified by the new habits so that by slow degrees the new structures and organs thus arising become preserved and transmitted by heredity. Although Lamarck did not discover the principle of natural selection, he recognized the fact of competition, of a struggle for existence, but did not dwell on them to the extent that Darwin and later observers did. In 1802, 1803 and 1806 he reiterated and somewhat extended these views, which were published in final form in 1809, in his 'Philosophie Zoologique,' and again, in 1815, in the introduction to his 'Animaux sans Vertèbres.' By this time Lamarck had become the greatest zoologist of the period between Linné and Cuvier. He was expert in detecting the limits between species, and has given us the best definition extant of a species.

Lamarck's Factors of Organic Evolution.—These in their essential form are contained in his famous two laws:

First Law.—In every animal which has not exceeded the term of its development, the more frequent and sustained use of any organ gradually strengthens this organ, develops and enlarges it, and gives it a strength proportioned to the length of time of such use; while the constant lack of use of such an organ imperceptibly weakens it, causes it to become reduced, progressively diminishes its faculties and ends in its disappearance.

Second Law.—Everything which nature has caused individuals to acquire or lose by the influence of the circumstances to which their race may be for a long time exposed, and consequently by the influence of the predominant use of such an organ, or by that of the constant lack of use of such part, it preserves by heredity (*génération*) and passes on to the new individuals which descend from it, provided that the changes thus acquired are common to both sexes, or to those which have given origin to these new individuals.

Lamarck also insisted that animals are modified in accordance with the diversity of their surroundings; that local causes, such as differences in soil, climate, etc., give rise to variations and that the whole surface of the earth affords a diversity in localities and habits, one region differing from another, that though the environment remains the same for a long time and species remain constant for that period, yet there is a slow gradual change, and species are modified in adaptation to such changes. Moreover such changes induce alterations in the wants or needs of animals: this necessitates other movements or actions to satisfy the new needs, and hence they give origin to new habits, and this leads to the use or exercise of some organ or organs in a new direction, with the result that different parts or organs are modified in adaptation to the new surroundings and necessities of existence. All this is perfectly true. We now know that by geographical changes or from lack of food animals are compelled to migrate into new regions, and are there obliged to adopt new habits and become transformed into new species or types. Thus

whales have descended from terrestrial forms; the baleen whale has in its embryo stage rudimentary teeth showing that it is a descendant of toothed whales. Lamarck refers to Geoffroy's discovery in embryo birds of the groove where teeth should be situated, and subsequently fossil birds with teeth were unearthed. The mole with its functionless eyes, due to underground life, the blind *Proteus* of Austrian caves, the headless and eyeless bivalve mollusks, these parts lost by disuse; the evolution by atrophy of the limbs of the snake, due to their lack of use in passing through narrow places; wingless insects whose wings have been lost by disuse; the webs between the toes of ducks, geese, as well as those in the feet of the frogs, sea turtles, otter and beaver, are mentioned by Lamarck as examples of the effect of use and exercise. Other examples of use results are the origin of horns in ruminants; the long neck of the giraffe, which by the absence of herbage was obliged to browse on the foliage of trees "and to make continual effort to reach it," the shapes of the carnivores, of the kangaroo and of the sloth which are accounted for by the necessity of their adopting new habits, and, by exercise in new directions, becoming adapted to the new conditions of life. Although Lamarck gave few illustrations, it may be doubted whether any one has since his day more satisfactorily explained the origin of such forms or modifications. Lamarck also accounts for the origin of man, suggesting in a tentative way his rise from an arboreal or ape-like creature, with a detailed hypothesis of the gradual process of his transformation, into a being with an upright posture, an enlarged brain, powers of reason and other human qualities. But besides these special cases Lamarck was broad and comprehensive in his views of nature and creation. He was the first to show that the animal series was not a continuous chain of being, but rather should be compared to a tree, with its branches. In fact he was the first to construct a genealogical tree, the first attempt at a phylogeny of the animal world. He demanded unlimited time for the process of evolution. He anticipated the uniformitarian views of Lyell. He pointed out that where, as in Egypt, the climatic conditions have remained the same for many centuries, species have remained constant, but that under a varying environment they become modified. He writes of the struggle for existence; shows that the stronger devour the weaker; he refers to the principle of competition in the case of the sloth. He repeatedly insists on the fact that vestigial structures are the remains of organs which were actively used by the ancestors of existing forms. He shows, what is much insisted on at the present day, that change of functions in organs leads to their transformation or recreation, and that the assumption of new habits precede the origin of new, or the modification of organs already formed. A great deal is now said of the effects of migration and consequent geographical isolation in the origination of new species; Lamarck invoked this factor in the case of man, and he also pointed out the swamping effects of intercrossing. Lamarck's theory of use-inheritance is denied by some, but by others is regarded as an important factor in evolu-

tion. He does not, however, refer to the inheritance of mutilations, etc.

All these views lie at the foundation of the theory of organic evolution; yet Lamarck's opinions were set aside, misunderstood and ridiculed. Some crude and ungrounded hypotheses were mingled with them. In his time the sciences of palæontology, embryology and bionomics were undeveloped. Lamarck collected but few facts, and he lacked the experimental skill of Darwin; so that it was reserved for the latter naturalist, half a century later, to convert the world to a belief in evolution. At present, however, it is acknowledged that Lamarckism affords the fundamental principles on which rests the theory of organic evolution, and many of the most eminent naturalists have worked and are working along Lamarckian lines.

Elliot's translation of the 'Philosophie Zoologique' (New York 1914); Spencer, H., 'Factors of Organic Evolution' (New York 1895); Cope, 'The Primary Factors of Organic Evolution' (Chicago 1896); Hutton, 'Darwinism and Lamarckism. Old and New' (London 1909).

ALPHEUS S. PACKARD,

Late Professor of Zoology, Brown University

LAMARTINE, la'mär'tên, Alphonse Marie Louis de Prat de, French poet and statesman. b. Mâcon, Burgundy, 21 Oct. 1790; d. 28 Feb. 1869. He came of well-to-do parents of royalist sympathies. His father was imprisoned during the Terror. He was educated first by his mother, then, after a brief period at Lyons, by the Pères de la Foi at Berry (1805-09). He then passed two years at home, reading poetry and romance, and was in Italy from 1811 to 1813. At the Restoration he entered the Gardes du Corps. The Hundred Days of Napoleon's return he passed in Switzerland and Aix-en-Savoie. Here a love affair with a girl who died soon after opened a copious poetic vein. After Waterloo he returned to France, revisited Switzerland, Savoy and Italy in 1818-19, and in 1820 published his first book, the much admired 'Méditations.' Soon after he left the army for the diplomatic service, was made secretary of the embassy at Naples and married a congenial, wealthy and beautiful English lady, Marianne Birch. 'Nouvelles Méditations' followed in 1824, with a transfer to Florence and the Cross of the Legion of Honor from Charles X in return for a laudatory poem. In 1829 came 'Les Harmonies,' with a mission to Saxe-Coburg and election to the Academy. The Revolution of 1830 terminated his diplomatic career. He entered politics, was defeated in the elections of 1832, made a journey to Palestine, of which he told in 'Voyage en Orient' (1835), was chosen deputy in his absence, and soon gained reputation as a ready speaker and effective orator, becoming steadily more democratic in his political sympathies. 'Jocelyn' (1836), 'La Chute d'un Ange' (1838), two fragments of a would-be epic of the human soul, and 'Recueils' (1839) contain his last significant poetry. The 'Histoire des Girondins' (1847) was less a history than a vaguely

declamatory invitation to the revolution of February 1848, in which Lamartine had a prominent part, being Minister of Foreign Affairs in the provisional government, a member of the Constituent Assembly by concurrent election in 10 departments, and one of its executive committee. His own inexperience and impatience of routine, joined to the futility of his colleagues and the unreason of the mob, led to the conspicuous failure of his efforts to govern by speeches and reconcile the middle class to democracy. In June he yielded to Cavaignac and got but few votes when nominated for the presidency in 1849. His political day was over. He was not even elected to the Assembly. Grown poor in the public service he tried to redeem his fortunes by much writing: 'Confidences' (1849), 'Raphael' (1849), both autobiographical, 'Nouvelles Confidences' (1851), histories of the French Revolution and the Restoration, biographical sketches of Columbus, Jeanne d'Arc, Oliver Cromwell and others, and stories in prose, of which 'Graziella' and 'The Stone Mason of Saint Point' are best known. He edited his own complete works in 41 volumes, 1858-63. A pension, tardy recognition of his sacrifices and his deeds was accorded him in 1867. Amiable, vain, fond of pose, picturesquely sentimental, fatally fluent alike with tongue and pen, with "a habit of inaccuracy" and rhetorical embellishment, without well-grounded political convictions, Lamartine's best titles to remembrance are the poems of his early years. (See MEDITATIONS.) Consult Brunetière, 'Evolution de la Poésie lyrique' (Vol. I, 107 ff.); Sainte-Beuve, 'Portraits contemporains' (Vol. I, 190 ff.); Deschanel, 'Lamartine' (Paris 1893); Doumic, R., 'Lettres d'Elvire à Lamartine' (ib. 1895); Séché, L., 'Etudes d'histoire romantique: Lamartine de 1816 à 1830' (ib. 1906) and 'Les amitiés de Lamartine' (ib. 1911); Lacretelle, P. de, 'Les origines et la jeunesse de Lamartine' (ib. 1911); Clouzet, G., 'Lamartine' (ib. 1912); Sachs, E., 'Les idées sociales de Lamartine' (ib. 1915). There are translations of the 'Girondists,' 'The French Revolution' and 'Restoration,' of 'Graziella' and the 'Stone Mason of Saint Point,' and of 'Raphael.' There are school editions of 'Columbus,' 'Jeanne d'Arc' and 'Cromwell' and of excerpts from the 'French Revolution.'

BENJAMIN W. WELLS,

Author of 'Modern French Literature.'

LAMB, Charles, English poet, critic and essayist: b. The Temple, London, 10 Feb. 1775; d. Edmonton, England, 27 Dec. 1834. Lamb was the youngest of three surviving children, among seven, of John Lamb, a clerk in the Inner Temple, and Elizabeth [Field] Lamb. Both parents were of humble and rural origin. Charles passed the first seven years of his life in the Temple, where he received some instruction, and in 1782 went to Christ's Hospital, where he remained the next seven years. Here he met his life-long friend and counsellor, S. T. Coleridge (q.v.). Lamb was known as a gentle and amiable boy, whose natural shyness and sensitiveness were increased by a trick of stammering, of which he never succeeded in completely ridding himself. Aside from these traits, there is to be noted the strain of mania in Lamb's family which in the boy expresses itself as excitability and nervousness. Other

important determinants in Lamb's career were the influence of Coleridge, which tended to develop thoughtfulness and a love of poetry, his own liking for early English authors, particularly the Elizabethans, and his genuine and un-failing delight in the life of the city. Though a fair scholar at school, Lamb was really more of a reader, and his reading had a great effect on his literary career and the quality of his work.

Shortly after leaving Christ's Hospital, Lamb entered the South Sea House. In 1791 he got a clerkship in the East India Company at £70 and there remained, with gradual increase in salary, until he was retired in 1825, on a pension of £441. From the time he entered business to his death, his life was singularly uneventful. The critical year, 1795-96, was marked by his father's falling into imbecility, his own solitary attack of mania, and (September 1796) his sister's stabbing of their mother in a fit of insanity. The nature of the hereditary complaint and his sister's need of a guardian determined his mode of life. He turned his back on an inchoate love affair, put aside all thought of marriage and devoted himself to his sister, as she to him in her sane moments. In 1797, on the death of their father, the two began their long life in London, unbroken except for one short trip to Paris. In the period their local home was changed but six times.

Lamb began his literary career in 1797 by the addition of three sonnets to a volume of Coleridge's. His poetical production was small; altogether during the course of his life his known poems number about 110, of which the best known are 'The Old Familiar Faces,' 'Hester' and 'On an Infant Dying as Soon as Born.' In 1798 he wrote 'Rosamond Gray and Old Blind Margaret,' a prose tale of sentiment. Though praised by Shelley and others for a charm that it undoubtedly possesses, the story, as a composition, is very incoherent and shows the writer's lack of technical skill. Structural defects equally great, because of lack of adequate motive in characterization, abound in Lamb's next attempt, 'John Woodvil,' a very undramatic drama, which was refused by Kemble in 1799 and published by Lamb in 1802. Nor was Lamb's third attempt at imaginative literature more successful: the farce, 'Mr. H.,' ran one night in 1806 and is probably one of the least dramatic pieces ever put on any stage. The truth of the matter is that Lamb had very little constructive ability in narrative and dramatic forms, that his attempts in them were due to the influence of the early dramatists, of whose work he was very fond and whose vogue he did much, later, to restore. His liking for them rested on their poetry rather than their dramatic ability.

In the next kind of work that he took up, Lamb had much better success. These were stories retold and they stand in three chief volumes, 'Mrs. Leicester's School,' 'Tales from Shakspeare' (both of 1807), and 'The Adventures of Ulysses' (1808), in many of which his sister was his coworker. Lamb had here his material made for him and, therefore, his own quality was less trammelled. The 'Tales from Shakspeare,' of which Charles wrote the tragedies and Mary the comedies,

quickly went into a second edition and has since become an English classic of a minor order. The stories are retold with much simplicity and with a very happy emphasis on the characters and the moral of the main situation; less is proportionately given to the under-plots. Next to the 'Essays of Elia' the 'Tales' are Lamb's best-known work.

In 1808 Lamb entered the field of criticism, and for the next decade his published writings indicate that his interests were, broadly, of a critical nature. His chief motive for this change seems to have been his desire to express in the form of comment the admiration for the early writers which he had expressed, by imitation, in his own dramas, and, by transcript, in such works as the 'Tales.' In 1808 appeared his 'Specimens of English Dramatic Poets Contemporary with Shakspeare,' with his valuable notes thereon. Other important essays are 'On the Tragedies of Shakspeare' and 'On the Genius and Character of Hogarth,' both of which appeared in Leigh Hunt's *Reflector* in 1811, an essay on Wordsworth's 'Excursion' in the *Quarterly* in 1814, and 'On the Poetical Works of George Wither' published in the collected works of Lamb, issued in 1818. There are also a few minor pieces of criticism, but the amount of Lamb's critical work is exceedingly small in view of its high reputation, and its form is fragmentary. Its place is probably due to the fact that Lamb did very much to restore to their rightful heritage those old writers from whom he drew much of his own inspiration and to the fact that, in an age of critical dogmatism, Lamb insists constantly, though not always with an eye to logic or historical fact, on broad appreciation.

Lamb's fame rests chiefly on the next important work, or rather kind of work, which he attempted. Having practically failed in creative narrative and drama and having achieved only a moderate contemporaneous success in fields of retold stories and criticism and poetry, he turned his attention to the literary essay and found it a proper vehicle for his peculiar genius. Lamb had from time to time during his earlier life as well as his later written miscellaneous essays of a quaintly humorous quality, like 'The Inconvenience of Being Hanged' (1811) and 'The Melancholy of Tailors' (1814), but the idea of regularly using the essay form did not occur to him until the famous 'Essays of Elia.' These were published as books in two series, in 1823 and in 1833, but they originally appeared in the *London Magazine*. For the first two or three years, from August 1820 to December 1822, they were published almost every month; after that they came out at very irregular intervals until 1833. Of the 51 essays and 16 'Popular Fallacies' in the two series only about 14 are really well known; of these 'Imperfect Sympathies' and 'A Dissertation on Roast Pig' are probably the most famous, though such essays as 'The South Sea House,' 'Mrs. Battle's Opinions on Whist,' 'Dream Children' and 'My Relations' are scarcely less well known and in no wise inferior. The essays have, in the main, come to be regarded as the best examples of the personal essay that English literature possesses. Certainly no English essays more completely reveal the personality of the author or reveal it in more winning terms. They are renowned

for their quaintness, their wit, their sympathy, their humor, their serenity and their reverence.

Between Lamb's retirement in 1825 and his death, his work in literature was of rather a miscellaneous character. A few essays of the Elia type and some miscellaneous pieces of criticism, and a wholly undramatic and unsuccessful drama, 'The Wife's Trial, or, The Intruding Widow,' are about all that he produced after he "came home forever." See *ESSAYS OF ELIA*.

Bibliography.—The best edition of Lamb's works is that by Canon Alfred Ainger, in six volumes. This does not include the 'Specimens,' which are most conveniently to be had in the Bohn Library. A full bibliography of Lamb's writing is to be found in B. E. Martin's 'In the Footprints of Charles Lamb' (New York 1890). Canon Ainger's 'Life,' in the *English Men of Letters*, is the most convenient biography of Lamb; it contains a short but excellent bibliography of the contemporary writers from whom we gain our knowledge of the author. To his list of titles may be added De Quincey's 'Recollections of Charles Lamb.' Of the many essays on the subject, that of Pater, in 'Appreciations,' is probably the nearest to finality.

WILLIAM T. BREWSIER,
Professor of English, Columbia University.

LAMB, Charles Rollinson, American architect and artist: b. New York. He established a high reputation for talented ecclesiastical architecture and decoration in his partnership with his brother Frederick as proprietors of the J. & R. Lamb Corporation. He designed the Dewey Arch erected at Madison Square (1899) for the triumphal procession after the Spanish War, and the Court of Honor erected for the Hudson-Fulton Celebration (1909) was from his designs. He was president of the Art Students' League and of the Municipal Art Society and is trustee for numerous art associations.

LAMB, Daniel Smith, American physician: b. Philadelphia, 20 May 1843. He took his M.D. at Georgetown University in 1867. He volunteered in the United States army in 1861 and was on duty in military hospitals throughout the war. He was acting assistant surgeon at the Army Medical Museum in 1868-92 and from 1892 to 1920 was pathologist there. He was professor of materia medica and then anatomy at Howard University, 1873-1923, and was professor of general pathology at the United States College of Veterinary Surgeons in 1894-1900. He conducted the autopsy on President Garfield. He edited the *Washington Medical Annals*, contributed numerous monographs on medical, sanitary and anthropological subjects and was author of 'History of the Medical Department, Howard University, Washington' (1900). Died, 21 April 1929.

LAMB, Horace, English mathematician: b. Stockport 27 Nov. 1849; d. 4 Dec. 1934. He was educated at Owens College, Manchester, and at Trinity College, Cambridge, where he was fellow and assistant tutor in 1872-75. He was professor of mathematics at the University of Adelaide, Australia, in 1875-85; and from 1885 to 1920 was professor of mathematics at Owens College and the University of Man-

hester. He was elected a Fellow of the Royal Society in 1884, was royal medalist in 1902 and in 1909-10 he served as vice-president of the society. Besides many papers on mathematical physics he is the author of 'Motion of Fluids' (1878); 'Hydrodynamics' (1895; 5th ed., 924); 'Infinitesimal Calculus' (1897; 3d ed., 907); 'Statics' (1912); 'Dynamics' (1914); 'Higher Mechanics' (1920).

LAMB, John, American soldier: b. New York, 1 Jan. 1735; d. there, 31 May 1800. He first worked in New York with the elder Lamb in the trade of optician and mathematical instrument maker, but in 1760 entered the liquor trade. He was one of the "Sons of Liberty" (q.v.) and active in all the early Revolutionary scenes in New York. He supported the resistance of the colonies to the "Stamp Act" and subsequently went to Philadelphia to urge a firm stand against any further oppression. Commissioned captain of artillery in 1775, he was authorized by Congress to remove the cannon from the Battery in New York on 23 August of that year; he subsequently took part in Montgomery's expedition against Quebec, where he was wounded and made prisoner. Later he rose to be colonel and at the time of Benedict Arnold's treason commanded at West Point. After the Revolution he was elected to the State legislature of New York, and for some years previous to his death held the post of customs collector of New York port. Consult the biography by Leake (Albany 1857).

LAMB, Martha Joan Reade Nash, American historian: b. Plainfield, Mass., 13 Aug. 1820; d. New York, 2 Jan. 1893. She was married to Charles A. Lamb in 1852 and removed with him to Chicago, Ill., where in 1863 she was secretary to the United States Sanitary Commission Fair. She made her home in New York from 1866 and was editor of the *Magazine of American History* from 1883 till her death. Her publications include a scholarly 'History of the City of New York' (1877-81); 'The Homes of America' (1879); 'Wall Street in History' (1883); 'The Christmas Owl' (1881); 'Snow and Sunshine' (1882).

LAMB, Mary Ann, a sister of Charles Lamb (q.v.).

LAMB IN ART. In the ancient Christian art of the Catacombs we find the lamb figuring as emblem of the Redeemer as early as the 3d century, though rarely, later to become quite commonly used to represent Christ, and referring to the mention by Saint John the Evangelist and the Jewish Paschal lamb. Some early depictions have an accompanying shepherd's staff, later the Good Shepherd appears. Early in the 4th century we find the symbols of the cross and nimbus, to be followed later by the cross and banner of the Agnus Dei that has continued to this day. Another early representation met with is that of Christ, in the form of a lamb, standing on a mount, from which four streams flow, typifying the four Evangelists. Other pictures give the Savior in human form with a lamb by His side and surrounded by 12 other lambs, symbols of the 12 Apostles. But the primitive Christians used the lamb or sheep as symbol of other Old and New Testament personages; as instances are those where it represents Moses, Saint John

the Baptist, the Apostles. In fact the Apostles are found represented by a lamb constantly in the Catacomb frescoes, ancient sarcophagi and ancient mosaics in Roman basilicas. Again, lambs have been used as symbolic of the 12 tribes of Israel. It is generally conceded in ecclesiastical art that when more than 12 lambs are presented they refer to the faithful. Entire Biblical scenes have been depicted in which the sacred personages performing take on the form of lambs. Illustrations which depict the lamb of the Apocalypse represent the symbol, with seven horns and seven eyes, breaking the seven seals of the mysterious book. It is often seen surrounded by crosses and with the four Evangelists depicted at the extremities; several sepulchral brasses display this combination. Ancient pictures portray the lamb performing numerous acts, such as raising Lazarus from the dead, multiplying the loaves in the wilderness, crossing the Red Sea. It is also found being baptized in the Jordan, standing at the foot of the cross, lying slain upon an altar, shedding blood from its breast into a chalice, blood pouring in four streams from its feet. In such cases the lamb is depicted always as carrying a cross. Early mosaics and frescoes show the lamb lying on a throne surmounted by a cross. The lamb pictured on chasubles and altar frontals is often lying, as if dead, upon the Book with the seven seals, also as holding, while standing, the banner of the Resurrection with the fore foot or the rear foot. In this action it has been accepted as the heraldic insignia of several towns, noble families and societies. Artists in depicting the Agnus Dei have generally accepted the following rules: The lamb's body is white; the head is surrounded with a nimbus of gold containing a red cross; the banner, depending from the traverse of a reclining cross, has a white field, red at the base point and a red cross in centre. The whole is usually enclosed either in a circle or quatrefoil with field *azure* (blue) or *gules* (red). As an attribute in ecclesiastical art the lamb is found accompanying Saint Agnes, Saint Genevieve, Saint Catherine and Saint Regina. Saint John is frequently depicted carrying a lamb or accompanied by the Paschal lamb, and buildings dedicated to this saint often show the lamb as decorative motif. In some pictures and statuary the lamb appears as symbol of the virtues the person represented was noted for, such as Innocence, Meekness, Patience, Purity.

CLEMENT W. COUMBE.

LAMBALLE, lán'bâl', **Marie Thérèse Louise de Savoie-Carignano**, PRINCESSE DE, French-Italian princess, friend of Marie Antoinette: b. Turin, 8 Sept. 1749; d. Paris, 3 Sept. 1792. She was the fourth daughter of Prince Louis Victor of Carignano and in 1767 was married to Prince de Lamballe who died in the following year. Upon the marriage of Marie Antoinette the princess returned to court and was accorded the favor of the royal lady, to whom her gentleness and submissiveness greatly appealed. They became close friends and upon Louis XVI's accession to the throne the queen made her superintendent of the royal household. The Comtesse de Polignac superseded her in 1776-85, when the queen sought a rec-

conciliation and resumed their former intimacy. The salon of the princess was used by the queen as a sort of headquarters for her various intrigues, and as this became known the populace believed the queen's innocent dupe to be the responsible party and hated her accordingly. When, after the Revolution, the royal family, in 1791, attempted to escape the princess made her way to England to appeal for aid for her royal friends. She returned to the Tuileries in November of that year and was permitted to share the queen's imprisonment in the Temple from 10 August until 19 August, when she was removed to La Force. On 3 September she was brought before the tribunal and commanded to take an oath against the king. Upon her refusal she was turned over to the mob, which tore her in pieces and bore her head on a pike before the windows of the queen in the Temple. Selections from her letters were published in Volume XXXIX, 'La Revolution française' (Paris 1900). Consult Bertin, Sir George, 'Madame de Lamballe' (Paris 1888); Lescure, Comte de, 'La Princesse de Lamballe' (1864); Hardy, B. C., 'The Princesse de Lamballe' (1908).

LAMBAYEQUE, läm-bā-yā'kā, Peru, a maritime department lying between the Pacific ocean and the departments of Piuria, Cajamarca and Libertad, having an area of 4,613 square miles. The department was created in 1874. It is settled only along the river valleys where irrigation is possible, and where water is obtainable there is good production of cotton, rice, tobacco and sugar-cane. In the uplands are districts which afford good pasturage. The population of the department, mainly of mixed blood, is estimated at about 140,000. The capital is Chiclayo, a town of 30,000 inhabitants, which is the centre of a rice and sugar district with well laid-out streets and the location of a cathedral and of a national college. Roads run from Chiclayo to Chongayape, Hualgayoc and Chota, and another to Lambayeque, a smaller town which was formerly the capital of the department. Montsefú, famous for hand woven textiles, is several miles distant.

LAMBEAUX, län'bō, Jef (Joseph Marie Thomas), Belgian sculptor: b. Antwerp, 1852; d. 6 June 1908. He studied at the Antwerp Academy of Fine Arts and under Jean Geefs. His first production, 'War,' was exhibited in 1871, but owing to financial difficulties his work for some years was confined to profitable humorous subjects. He then went to Paris to study, and in 1881 executed his masterpiece, 'The Kiss,' which is in the Antwerp Museum. He later studied in Italy where the work of Jean Bologne greatly impressed him, although his style undoubtedly was formed by the Flemish masters. His fountain at Antwerp (1886) is a fine example of his work, and among other famous pieces are 'Robbing the Eagle's Eyrie' (1890); 'The Bitten Faun' (1905), and a colossal marble bas-relief, 'The Human Passions.'

LAMBECK, läm'bēk, or **LAMBECCIUS**, Peter, German scholar: b. Hamburg, 13 April 1628; d. Vienna, 7 April 1680. He studied at Hamburg, Amsterdam, Paris and Rome, was teacher of history in the gymnasium at Hamburg from about 1650 to 1662 when he became rector. In 1662 he was converted to the Roman Catholic faith and went to Vienna, where

in 1665 he was installed as librarian of the Imperial Library. His most valuable works are 'Commentarii de Bibliotheca Cæsarea Vindobonensi' (8 vols., Vienna 1665-69), and the 'Prodromus' of the unfinished 'Historia Literaria' (1710).

LAMBERT, Alexander, American pianist: b. Warsaw, Poland, 1 Nov. 1862. He studied in early life with his father, and on the advice of Rubinstein was sent to the conservatory at Vienna, where he graduated in 1880. In 1881 he gave a series of concerts in New York, which he repeated the next season through Germany and Russia. After studying for a while under Liszt he returned (1884) to the United States, and from 1888 to 1906 was director of the New York College of Music when he resigned in order to devote his entire time to private teaching. He is author of many compositions, but is best known as a successful teacher. He has written 'Systematic Course of Studies' (6 vols., 1892), and 'Piano Method for Beginners' (1907), which is in use extensively in the United States.

LAMBERT, Daniel, English citizen famed for his unusual corpulence: b. Leicester, 13 March 1770; d. 21 July 1809. Up to his 19th year he gave no indications of the remarkable stoutness which he afterward attained, being an enthusiastic lover of field sports and athletic exercises. He succeeded his father as keeper of the Leicester prison, exchanged an active for a sedentary life, and from this time rapidly increased in size till he became an object of public curiosity and attracted visitors from all parts of the country. He now resolved to turn his obesity to account, and in 1806 commenced an exhibition of himself in Piccadilly, London. He afterward exhibited himself in the principal towns of England. At the period of his death he was 5 feet 11 inches in height, weighed 739 pounds and measured 9 feet 4 inches round the body and 3 feet 1 inch round the leg. In diet he was remarkably abstemious, drank water only and never slept more than eight hours.

LAMBERT, Eugène Louis, French painter: b. Paris, 24 Sept. 1825; d. 1900. He studied under Delacroix and Delaroche and made his début at the Salon in 1847. He is famous chiefly as a painter of cats, the remarkable success of his 'Chat et Perroquet' (1857) largely influencing his choice of subjects in later years. He became a member of the Legion of Honor in 1874 and was awarded third medal at the Exposition Universelle in 1878. His work is familiar throughout the United States, and his 'Cat and Kittens' (1870) hangs in the Metropolitan Museum, New York. His 'Family of Cats' (1887) is in the Luxembourg. The charming illustrations for Cherville's 'Chiens et chats' (Paris 1889) are his work.

LAMBERT, Johann Heinrich, vō'hän hīn'rīh läm'bērt, German mathematician and philosopher: b. Mülhausen, in Alsace, 26 Aug. 1728; d. Berlin, 25 Sept. 1777. His father was a tailor in humble circumstances, and he was obliged to follow his father's employment. In this situation he spent the greatest part of the night in study and soon acquired a knowledge of mathematics, philosophy and the Oriental languages. At the early age of 19 he discovered

the so-called "Lambert's theorem." He became tutor to the sons of Salis, President of the Swiss Confederation, accompanying his pupils (1756-59) on a continental tour. In 1759 he was released from his duties, and in 1764 Frederick the Great appointed him to the head of the Architectural Council and made him a member of the Academy of Sciences. He enriched the transactions of various societies with his papers and treatises, all of which bear the stamp of eminent and original genius. Most of his mathematical pieces were collected in three volumes by himself. Philosophy, and especially analytic logic, are greatly indebted to him for his 'Neues Organon, or Thoughts on the Examination and Relations of Truth' (1764), and his 'Architektonik, or Theory of the First Simple Principles in Philosophical and Mathematical Knowledge' (1771).

LAMBERT, John, English soldier: b. Kirkby Malhamdale, Yorkshire, 7 Nov. 1619; d. 1683. He entered the army and had attained the rank of colonel in 1644, when he fought against the king at the battle of Marston Moor. He assisted Ireton in drawing up the "Heads of the Proposals," in 1647; was a brave, chivalrous and able soldier and the idol of the army, holding a place second only to Cromwell, was generous in his treatment of Royalist prisoners and took no part in the measures leading up to the execution of the king. He accompanied Cromwell into Scotland in 1650, specially distinguished himself at Dunbar and Worcester, and took the lead in the council of officers who gave the Protectorate to Cromwell. He subsequently opposed the Protector and was deprived by Cromwell of all his commissions, though a pension of £2,000 was allowed him for past services. When Richard attempted to assume the Protectorate Lambert came forward and became the head of the Fifth Monarchy Men, or extreme Republicans. In August 1659 he suppressed a dangerous Royalist rising at Chester, in the same year was member of Parliament for Pontefract, dismissed the "Rump" Parliament, governing with the aid of Council of Public Safety. In order to detach him from the Commonwealth suggestions were made by Royalists for a marriage between Prince Charles or his brother the Duke of York and his daughter. In 1660 he set out for the north to encounter Monk, but was deserted by his troops, seized and committed to the Tower, whence he soon escaped, again attempted to gather troops and was again arrested. At the Restoration he was excepted from the act of indemnity, brought to trial and condemned in 1662, but his sentence was commuted to banishment to Guernsey, from whence he was removed to Drake's Island, Plymouth Sound.

LAMBERT, John, English traveler: b. about 1775; d. unknown. He visited North America in 1806-09 under the auspices of the Board of Trade, with the object of introducing hemp-raising in Canada in order to render England independent of the hemp of northern Europe, with which supply Napoleon was interfering. This project was unsuccessful, but Lambert remained in America exploring "those parts made glorious by Wolfe and Washington" and studying "the effect of the new government." He published the results of his in-

vestigations a year after his return to England, 'Travels through Lower Canada and the United States of North America, 1806-08' (3 vols., London 1810). The work is written from a liberal standpoint and ran through three editions. He also edited and wrote a preface for the 'Essays' of Washington Irving (2 vols., London 1811), after which time nothing is known of him.

LAMBERT, Louis A., American Roman Catholic clergyman: b. Charleroi, Pa., 13 April 1835; d. 1910. He was educated at Saint Vincent's College, and the archdiocesan seminary, Saint Louis, and was ordained to the priesthood in 1859. He was chaplain in an Illinois regiment during the Civil War, was pastor at Cairo, Ill., 1863-69, and subsequently at Seneca Falls and Waterloo, N. Y.; was professor of normal theology and philosophy at the Paulist Novitiate. He founded the *Catholic Times*, in 1874, and was its editor till 1880, and after 1894 was editor-in-chief of the New York *Freeman's Journal*. He was involved in a controversy with Robert G. Ingersoll, and his side of the controversy was published in a volume. The bishop of Rochester, Dr. McQuaid, refused to assign Dr. Lambert to a parish in his diocese, but was overruled by the Pope. Thereupon Dr. Lambert was made rector at Scottsville, N. Y., where he remained until his death. He published 'Thesaurus Biblicus'; 'Notes on Ingersoll'; 'The Christian Father'; 'Tactics of Infidels,' etc.

LAMBERT VON HERSFELD, German historian: b. probably Thuringia; d. Benedictine monastery at Hersfeld, 1088. He was finely educated, ordained a priest at Aschaffenburg, and is sometimes spoken of as Lambert of Aschaffenburg or Shafnaburg. He entered the Benedictine monastery at Hersfeld in 1058, and made a pilgrimage to the Holy Land, visiting many monasteries of his order. His fame rests upon his 'Annals,' a history of the world from its beginning until 1077. Lambert followed the work of other historians until 1040, when he emerged as an independent historian treating familiar contemporaneous history. The work is written in a beautiful Latin and the style is excellent. The writer is definitely antagonistic to Henry IV, whose visit to Canossa is brilliantly described, as is the battle of Hohenburg; and the work, naturally, is strongly in favor of the papacy. Until recently the fairness and accuracy of the 'Annals' have been unquestioned. The 'Annals' were first published in 1525, in the 'Monumenta Germaniae historica,' (Bänd III and V Hanover and Berlin 1826 fol.), and translated into German by Hesse (Leipzig; 2d ed., 1893). He is credited with the authorship of some of the monastery records, and with 'Carmen de Bello Saxonico,' edited by Pannenberg (Göttingen 1892), and by Holderegger (Hanover 1894). Consult Delbruck, H., 'Über die Glaubwürdigkeit Lambert von Hersfeld' (Bonn 1873), and Potthast, A., in 'Bibliotheca Historica' (Berlin 1896).

LAMBERTON, Benjamin Peffer, American rear-admiral: b. Cumberland County, Pa., 25 Feb. 1844; d. 9 June 1912. He was graduated at the United States Naval Academy in 1864 and was assigned to the United States steamer *America* for service during the remainder of

the Civil War. He was regularly promoted and at the outbreak of the Spanish-American War was chief of staff for Admiral Dewey. After the battle of Manila Bay he was advanced in rank seven numbers for "eminent and conspicuous conduct." He commanded Admiral Dewey's flagship, United States steamer *Olympia*, in 1898-1899, served on the naval retiring board in 1900, and on the lighthouse board in 1900-1903. He was in command of the South Atlantic squadron in 1903-1904 and served at the Naval War College in 1904. He was chairman of the lighthouse board in 1905-1906 and was retired Feb. 25, 1906.

LAMBERTON, John Porter, American editor and author: b. Philadelphia, Oct. 22, 1839; d. July 26, 1917. He was graduated from the University of Pennsylvania in 1858 and received degree of A.M. in 1861. He was teacher of classics in several academies (1859-1880), but was obliged to retire from this field on account of the impairment of his hearing. Entering upon literary work he was associate editor of the *American Supplement* to the Encyclopaedia Britannica (9th ed.), and assisted in preparing the index to that edition of the Britannica. He was for five years (1891-1896) in the editorial department of the J. B. Lippincott Company and revised *Worcester's Dictionary* and other works of reference published by it. He was managing editor and chief writer of *Historic Characters and Famous Events*, 12 vols. (1896-1898) and *Literature of All Ages*, 10 vols. (1898-1899). To the series *Six Thousand Years of the World's History* he contributed *Literature of the 19th Century* (1900). He prepared an educational work on *English Literature* (1903); revised and enlarged *The Drama* of Alfred Bates (1905-1907). In 1902 he became an assistant in the library of the University of Pennsylvania.

LAMBERTVILLE, city, New Jersey, in Hunterdon County; altitude 50 feet; on the Delaware River; and on the Pennsylvania Railroad, 16 miles northwest of Trenton; connected with New Hope, Pa., by bridge. The surrounding region is agricultural. It has manufactures of textiles, furniture, and leather goods. Before the Delaware and Raritan Canal was abandoned, the feeder running through Lambertville was a busy waterway. Before and during the Revolutionary War, Samuel Coryel operated a ferry here, and the settlement was called Coryel's Ferry. The present name came into use after the War of 1812, when John Lambert opened a post office. Lambertville became a city in 1872 and has commission government. Pop. (1950) 4,477.

LAMBERVILLE, lām'bēr-vēl, Jean de, French missionary: d. Paris, Feb. 6, 1714. In 1671, as a member of the Jesuit order and under their direction, he settled in the Iroquois village of Onondaga. He had previously spent three years in Canada, and he now became active in cementing the alliance between the Indians and the French. Meanwhile Governor Thomas Dongan of New York was straining every nerve to win over the Iroquois League to the English, but without success. Lambertville, who was chaplain of the French garrison at Forts Frontenac (Kingston) and Niagara, was obliged to abandon his post by the risk he

ran when the Iroquois delegates were treacherously seized at Fort Frontenac to which they had repaired on receiving pledges of a peaceful conference (1687). In 1691, he was at Saul Saint Louis. He returned to France in 1694, and for the next 20 years was procurator for the Canadian mission.

LAMBESSA, lām-bēs'ā, or **LAMBESI** (ancient LAMBAESIS), commune, Algeria, in the Department of Constantine, seven miles south east of Batna and 17 miles west of Timgad. The town owed its ancient importance to a Roman military camp founded there under Hadrian, 123-129 A.D.

The modern village has an agricultural colony founded in 1848 and a large convict establishment built about 1850. The village is interesting chiefly because of its historical remains. While vandalism has destroyed many of these those still existing are cared for by the Service des Monuments Historiques. There are triumphal arches erected to Septimian Severus and Commodus; the capitol or temple dedicated to Jupiter, Juno and Minerva, which has a portion of eight columns; a splendid building in the old Roman camp dating from 268 A.D.; cemetery to the north and east with the stones still standing, although those to the west of the village have had their stones removed for building purposes. There are, besides, remains of an amphitheatre, arsenal, baths, residences, an aqueduct, a single standing column of the temple to Aesculapius and some fine statues and mosaics.

The ruins of the town have yielded many inscriptions, of which L. Renier edited 1,500 and 4,185 are in the *Corpus Inscriptionum Latinarum*. More than 2,500 of the inscriptions relate to the Roman camp. Pop. (1948) 1,418.

Consult Renier, L., *Inscriptions romaines de l'Algérie* (Paris 1855); Graham, A., *Roman Africa* (London 1902).

LAMBETH, a municipal and parliamentary borough of London, Eng., on the right bank of the Thames, opposite Westminster area, 4,080 acres. Lambeth has been famous for its potteries for over 200 years; soap and chemicals are the other chief manufactures.

Lambeth Palace has been the official residence of the archbishops of Canterbury since the end of the 12th century. The oldest part remaining is the Early English Chapel. The so-called Lollard's Tower dates from 1440. The palace contains a fine series of portraits of the archbishops and possesses a magnificent library containing a valuable manuscript collection. Lambeth suspension bridge crosses the river below the palace. Astley's Circus and Vauxhall Gardens, at one time famous resorts, were located here.

The borough for parliamentary purposes is divided into four constituencies, each returning one member.

During World War II the famous palace library wing, built in 1663, was demolished and St. Thomas' Hospital, built in the 9th century was badly damaged by robot bombs. Pop. (1951) 230,105. See also LAMBETH ARTICLES; LAMBETH CONFERENCE.

LAMBETH ARTICLES, in the Anglican Church a name given to a statement of certain doctrines of predestination, justification and free-will, drawn up at Lambeth Palace in 1595 by William Whitaker, master of

John's College, Cambridge, and other Anglicans who leaned toward Calvinism, including John Whitgift, Archbishop of Canterbury. They were rejected by Queen Elizabeth I.

Consult Curtis, W. A., *History of Creeds and Confessions of Faith* (Edinburgh 1911).

LAMBETH CONFERENCE, the name given to assemblies of bishops of the Anglican Communion, held approximately every ten years at Lambeth Palace, the official residence of the archbishop of Canterbury in London, England. The Conference is regularly attended by bishops of the Protestant Episcopal Church in the United States as well as by bishops of the Church of England and its branches throughout the British Commonwealth. The conference does not pretend to legislate, or promulgate official doctrine; but its pronouncements on matters of faith and morals reflect the consensus of the higher clergy of the Anglican Communion.

The idea of a pan-Anglican conference was first put forward by John Henry Hopkins, first Protestant Episcopal bishop of Vermont, in 1851. It was revived in 1866 by the Anglican bishops of Canada, as a means of coping with problems arising from controversy over the writings of John William Colenso (q.v.), bishop of Natal. The first assembly, in 1867, was attended by 76 bishops; but nearly as many others, doubting its propriety, remained away. Succeeding assemblies gained greatly in attendance and influence. The most important practical outcome of the Conference in its first half century was its endorsement, in 1888, of the Lambeth Quadrilateral, a set of four articles of faith defined as a basis for reuniting Christendom. The articles stipulate acceptance of the Old and New Testaments as the full and ultimate canon of faith; assent to the Apostles' Creed and the Nicene Creed; acknowledgment of baptism and the Supper of the Lord, as the only sacraments ordained by Jesus; and acknowledgment of the historic episcopate, locally adapted to the peculiar needs of nations and peoples.

Consult Curtis, William Redmond, *Lambeth Conferences; the Solution for Pan-Anglican Organization* (New York 1942); *Lambeth Conferences, 1867-1948; the Reports of the 1920, 1930, and 1948 Conferences, with Selected Resolutions from the Conferences of 1867, 1878, 1897, and 1908* (New York 1950).

LAMBIN, lān-bān', Denis (Latin DIONYSIUS LAMBINUS), French philologist: b. Montreuil-sur-Mer, France, 1516; d. Paris, September 1572. He was educated at Amiens and in Italy, and was appointed professor of eloquence (1560) and professor of Greek (1561) in the Collège Royal, Paris. He is reported to have worked with painstaking slowness, but he produced several celebrated editions of classical authors, notably of Horace (1561), Lucretius (1564), Cicero (1566), Cornelius Nepos (1569), Demosthenes (1570), and Plautus (1576).

LAMBKILL. See MOUNTAIN LAUREL.

LAMBRUSCHINI, lām-brōō-skē'nē, Luigi, Italian Roman Catholic prelate and statesman: b. Genoa, Italy, May 16, 1776; d. Rome, May 12, 1854. He entered the order of Barnabites at an early age, and subsequently was archbishop of Genoa (1819), papal nuncio in Paris (1827-1830), and secretary of state to Pope Gregory XVI (after 1836). He was created a cardinal in 1831.

As papal secretary of state he opposed innovations and tried vainly to strengthen the temporal power of the papacy. Compelled to flee Rome by an uprising in 1848, he joined Pope Pius IX in exile at Gaeta, where he remained until 1850. He was the author of *Opere Spirituali*, 3 vols. (2d edit. 1838).

LAMB'S CLUB, a social club in New York, N. Y., composed chiefly of actors, musicians, and playwrights, incorporated May 10, 1877. It was organized in 1874-1875 by a group of newspapermen, authors, and theatrical performers who had formed the habit of dining together periodically at the United States Hotel. Its name was derived from a similar London club. A provision of the constitution limits the non-professional membership to one-third of the total. The president of the Lambs is called the Shepherd; the vice president is the Boy; and an officer called the Collie manages the club's annual "Gambol," an entertainment comprising notable features of each season's plays, presented by the principals. The Gambol formerly toured larger cities in the United States each spring, yielding funds to finance the building of a clubhouse at 128 West 44th Street, in the theatrical district of Manhattan.

LAMB'S LETTUCE. See CORN-SALAD.

LAMB'S-QUARTERS, a pigweed (*Chenopodium album*), found wherever there is sunlight, loose, cultivated soil, and moisture. It is fast growing, and reaches a height of three feet, bearing alternate, lobed leaves up to four inches long, and, close to the stem, clusters of fruits that persist through the winter. The flowers are greenish and small. The fruits and young plants are edible, cooked or raw. Control is commonly by cultivation, before the plant flowers. Lamb's-quarters was probably introduced into the United States from Europe or Asia, by way of agricultural shipments.

LAME, là-mā', Gabriel, French mathematician and engineer: b. Tours, France, July 22, 1795; d. Paris, May 1, 1870. He became interested in the mathematical analysis of elasticity and heat conduction in solids, and introduced important new mathematical concepts, notably generalized curvilinear coordinates.

LAMECH, lā'mēk, in the Old Testament, the name of one or possibly two Hebrew patriarchs who lived before the Flood. A genealogical list in Genesis 4:1-24 mentions Lamech as the son of Methuselah and father of Tubal, Tubalcain, and Jubal. A list in Genesis 5 mentions Lamech as the son of Methuselah and the father of Noah. See also SCROLLS, THE DEAD SEA.

LAMENNAIS, là-mē-nē', Félicité Robert de (originally FÉLICITÉ ROBERT DE LA MENNAIS), French priest, philosopher, and apostate from the Roman Catholic Church: b. St. Malo, France, June 19, 1782; d. Paris, Feb. 17, 1854. In 1808 he published (with his elder brother, Jean-Marie) *Réflexions sur l'État de l'Eglise en France pendant le XVIIIème Siècle et sur la Situation Actuelle*, which was suppressed by the French police because of its handling of controversial issues. He entered the Roman Catholic clergy in 1809, but was not ordained until 1816. After his ordination he began the pub-

lication of his monumental work 'Essai sur l'indifférence en matière de religion' (4 vols., 1817-24; English trans. by Stanley, London 1898). With the fervor of intellectual conviction he advocated a strict restoration of the original Catholic doctrine. He denounced the spirit of individual inquiry which Descartes, Rousseau and Luther had stimulated to the detriment of the church and the state. Politically he favored the submission of temporal to spiritual authority and advocated a form of democracy deriving its power from a theocracy. Pope Leo XII at first approved of his religious philosophy, and invited Lamennais to visit Rome where he was graciously received and offered a place in the Sacred College. He preferred, however, to return to France, where he already had a large following, especially among the younger clergy, and with Chateaubriand he soon became known as a political power. His essays appeared in the *Conservateur* for a time, but the monarchical tendencies of de Villèle, one of the chief owners of the paper, soon alienated his sympathies, and he began to publish two independent journals, *Le Drapeau blanc* and *La Memorial Catholique*. From 1825-26 he was also occupied with the publication of 'De la religion considérée dans ses rapports avec l'ordre civil et politique.'

At La Chênaie, Lamennais with a brilliant following, including among its ranks Lacordaire, Gerbet, Rohrbacher, Salmis, de Carné, and later de Guérin, worked enthusiastically for his great reforms. The organ of this group was the journal *L'Avenir*, which took as its motto, "Dieu et Liberté"; and the body of active sympathizers and workers for the cause of theocratic democracy was known as the "Agence générale pour la défense des intérêts catholiques." The liberal tone of the paper offended a great number of the conservative clergy, and Lamennais resolved to go to Rome to take the matter up with the Pope. Accordingly, he suspended publication, and with Lacordaire set out for the Holy City in 1831 to meet Gregory XVI. They were, to their surprise, coolly received by the Pope, who asked them to drop the matter. All obeyed promptly except Lamennais who still hoped for a favorable reception; but when further letters of the Pope indicated clearly his concessions to temporal authority, Lamennais abandoned hope. Shortly after his departure, the encyclical "Mirari vos" was sent out by Rome in which Gregory formally denounced the theories set forth in *L'Avenir* and propagated by the "Agence." Broken-spirited, the party returned to La Chênaie where, in 1834, Lamennais wrote his stirring answer, 'Les Paroles d'un croyant,' which he sent to Sainte-Beuve for publication. Gregory made reply in the encyclical "Singulari nos" (1834).

It was not long before Lamennais rallied his force and his followers and began to direct his energy toward the championship of the rights of the people alone. In support of "la liberté et la humanité" he wrote 'Les Affaires de Rome' (1836); 'Le Livre du peuple' (1837); and 'Le Pays et le gouvernement' (1840), for which he was imprisoned for a year at Sainte-Pelagie, where he wrote 'Une Voix de prison.' This was followed in 1843 by 'Amschaspands et Darvands.' 'Le Deuil de

la Pologne' (1846), and numerous other pamphlets and treatises. In 1840 he collected the articles which had appeared in *L'Avenir* and published also a remarkable work in three volumes, 'Esquisse de philosophie.' The third volume entitled 'De l'Art et du beau' still remains one of the finest of discussions on æsthetics. He was recognized as one of the leaders of the Liberal Democratic party, and in defense and support of the Revolution of 1848 published *Le peuple constituant*, which, like a later publication, *La Revolution démocratique et sociale*, was forced to an early death through lack of financial means. He was chosen a member of the Constituent Assembly where he sat with the Extreme Left. His last years were occupied with the translation of Dante's 'Divina Commedia.' He refused to accept a church burial, and was interred without any religious ceremony.

Several volumes of posthumous works and letters have been published by Forgues (1858); H. de Courcy (1862); A. Blaize (1866); by A. du Bois de la Villèrabel (1866); and M. A. Rousel (1892). Incomplete collections of his works have been made, one in 10 volumes (Paris 1836-37); and another in 10 volumes (Paris 1844). Consult also Blaize, A., 'Essai biographique sur M. de Lamennais' (1858); Brunetière, F., 'Nouveaux essais sur la littérature contemporaine' (1893); Janet, Paul, 'La philosophie de Lamennais' (1890); Renan, E., 'Essais de morale et de critique' (1857); and Sainte-Beuve, 'Portraits Contemporains' (1832) and 'Nouveaux Lundis.'

LAMENTATION FOR THE DEAD.

See FUNERAL RITES.

LAMENTATIONS, Book of. See JEREMIAH, LAMENTATIONS OF.

LAMETH, la'mēt', Charles Malo François, COUNT DE, French general and politician; b. Paris, 5 Oct. 1757; d. Pontoise, 28 Dec. 1832. He served in the French expeditionary force which aided the American Revolutionists, was aide to Rochambeau and at the battle of Yorktown received serious wounds. He was deputy to the States-General in 1789; and in 1791 he was elected to the National Assembly by the nobility. His opposition to Mirabeau resulted in his arrest and he fled to Hamburg where he remained until 1800. He returned to France under the consulate, fought under Napoleon and was made governor of Würzburg. In 1814 he joined the Bourbons, and in 1820 succeeded his brother, Alexandre, as deputy.

LAMIA, a mythical queen of Libya, who, on being robbed of her own children by Hera, devoted her life to strangling and eating children. In later story Lamia was a vampire who seduced and then sucked the life-blood of young men. As a vampire she appears in Goethe's 'Die Braut von Korinth' and Keats' 'Lamia.'

LAMIA, (Turkish Zeituni or Zituni), city of Greece, capital of the provinces of Phiotis and Phocis, near the head of the Gulf of Lamia, 28 miles southeast of Pharsalos. It is situated upon the side of a hill crowned by a mediæval fortress, and has remains of the ancient city from which the Lamian War (323 B. C.) takes its name. On the south of the gulf is the Pass of Thermopylæ. The modern city has

azaar, gardens and a mosque. Its principal industry is the raising of camels. The city resumed its ancient name after Turkish rule was thrown off. Famous in its more recent history is the nearby bridge of Alamanna, where, in 1821, 700 Greeks commanded by Diakos and the bishop of Salona withstood the progress of the Turkish army. Pop. 14,712.

LAMIA, lām'ī-ā. This narrative poem in couplets was written by Keats in 1819 and published, together with *Isabella* and *The Eve of Saint Agnes*, in 1820. Keats founded his poem on an incident given by Burton in the *Anatomy of Melancholy* from Philostratus, concerning the marriage of a Corinthian youth to a serpent-woman or Lamia. At their wedding her real nature is detected by the philosopher Apollonius, and on being denounced she vanished. The story belongs to a familiar type of folklore incident, commonly known as the "swan-maiden motive," of which Coleridge's *Christabel* is another example in literature. Keats does not, like Coleridge, emphasize the supernatural suggestiveness of his material, but is interested rather in its picturesque and emotional values. He prefaces the meeting of Lamia and Lycius by a brilliant description of the serpent and an account of her transformation by Hermes into a woman. Lycius is enthralled by love and the enchantment endures until the fatal desire comes upon him to marry the maiden in the presence of his friends. The close of the poem is made to illustrate Keats' favorite idea of the antagonism between the life of feeling and abstract reflection. Apollonius, who comes uninvited to the feast, represents the chilling philosophy which destroys the illusions of poetry and romance. The poet's sympathies are all with the enamored lovers. In style and versification *Lamia* shows traces of the influence of Dryden. The rich sensuousness of *The Eve of Saint Agnes* here takes on an almost metallic brilliancy, but the poem is a little inferior as a work of art. For references see article ODE ON A GRECIAN URN.

JAMES H. HANFORD.

LAMINARIA, lām-ī-nā-rī-ā, an important genus of brown seaweed of the family Laminariaceae, prolific in the colder coastal waters of the temperate zones. The species has no definite leaves, the thallus forming a ribless expansion, flat and ribbon-like, either simple or cleft. A few species are edible, while others are employed as fertilizers and in the making of kelp. Among them *L. bulbosa* and *L. digitata*, which attain immense length, were formerly important in the production of carbonate of soda, but the discovery of common salt as a more accessible and prolific source of supply has largely superseded their use. *L. potatorum* is a native of the Australian coasts and furnishes the natives with food and material for domestic utensils and implements. *L. bucinalis*, a native of the Cape of Good Hope, yields iodine, while several Japanese varieties are edible.

LAMINATION, lām-in-nā'shūn, the division or divisibility of rock into thin layers or sheets. Lamination occurs chiefly in rocks composed of fine-grained materials and evidently is produced by deposition in water and variation in the nature of material deposited. The term

usually is limited to stratified rock, although some geologists apply it to the tabular structure of igneous crystalline rocks.

LAMMAS, lām'ās, **DAY** (M.E. hlammaesse, "loaf-mass") in the calendar, the 1st day of August, so called perhaps from the custom which formerly prevailed among the tenants who held lands of the cathedral church in York, England, of bringing offerings of the first fruits of the harvest in the form of wheat loaves on that day.

LAMMASCH, lām'āsh, **Heinrich**, Austrian jurist: b. Seitenstetten, May 21, 1853; d. Salzburg, Jan. 6, 1920. He studied at Vienna and was appointed law lecturer there in 1878. In 1885-1889 he was professor at the University of Innsbruck, and in 1889 he became professor of law at Vienna. He entered the Austrian Upper House in 1899 and became leader of the Conservatives. He represented Austria at the First Hague Conference (1899) and in 1911 was president of the Hague Tribunal. He was an arbitrator on the Venezuela case, 1903-1904; and presided over the boards deciding the Muscat case, 1905, and the Newfoundland fisheries controversy in 1910. He published *Moment objektiver Gefährlichkeit im Begriffe des Verbrechensversuche* (1879); *Diebstahl und Beleidigung* (1893); *Rechtskraft internationaler Schiedssprüche* (published by the Nobel Institute, 1913); *Schiedsgerichtsbarkeit* (1914), etc.

LAMMERGEIER, lām'ēr-gī-ēr, the largest of European eagles (*Gypaëtus barbatus*), often called griffon-vulture because it frequently feeds on carrion, especially bones abandoned by other animals, which it has power to break, or carries to a great height in the air and then lets fall; it does the same with tortoises, which form an important part of its fare in some countries. The lammergeier is a bird of the mountains and deserts of southern Europe (where it has now been nearly exterminated), northern Africa and southern Asia; it builds a great rude nest on some mountain ledge and lays a single brown-blotched egg.

LAMON, lām'un, **Ward Hill**, American biographer: b. 1828; d. Martinsburg, W. Va., May 7, 1893. He was the law partner of Abraham Lincoln at Springfield, Ill., and after the latter's election as president became his private secretary and was appointed by him marshal of the District of Columbia. He published *Life of Abraham Lincoln, from His Birth to His Inauguration as President* (Boston 1872); *Recollections of Abraham Lincoln*.

LAMONT, lā-mōnt', **Daniel Scott**, American politician: b. Cortlandville, N. Y., Feb. 9, 1851; d. Millbrook, N. Y., July 23, 1905. Educated at Union College, Schenectady, he entered journalism at Albany, became a political correspondent, was private secretary to President Cleveland in 1885-1889, and was secretary of war in Cleveland's second administration (1893-1897). Secretary of the Navy William C. Whitney in 1889 launched him in street-railway financing from which he accumulated a fortune. He was vice president of the Northern Pacific Railway Company from 1898 to 1904.

LAMONT, lā'mōnt, **Johann von**, Scot-

tish-German astronomer and physicist: b. Braemer, Aberdeenshire, Dec. 13, 1805; d. Munich, Aug. 6, 1879. Sent as a child to be educated at the Scottish monastery at Regensburg, he appears never to have returned to his native land. Assistant at the Bogenhausen observatory near Munich in 1828, he was director from 1835 until his death, also professor of astronomy at the University of Munich from 1852. His fame rests mainly on 11 zone catalogues of 34,674 stars; measurements of nebulae and clusters; and observations of the satellites of Uranus resulting in determination of its mass. In 1840 he established a magnetic observatory at Bogenhausen. He made magnetic surveys of Germany, France, Spain and Denmark; announced the magnetic decennial period (1850) and discovery of earth currents (1862).

LAMONT, Thomas William, American financier: b. Claverack, N. Y., Sept. 30, 1870; d. Boca Grande, Fla., Feb. 2, 1948. Son of a rural Methodist minister, he passed his boyhood years in the small Hudson River communities where his father held pastorates. Graduating at Harvard in 1892, he worked as a reporter on the New York *Tribune*, then entered a food production house which he reorganized as Lamont, Corliss and Co. Secretary and treasurer of the Bankers Trust Company in 1903, he became vice president two years later and in 1908 transferred to the First National Bank. In 1911 he became a partner of J. P. Morgan and Co. Under the younger Morgan, Mr. Lamont and H. P. Davidson developed and carried out the plans for American financial help to Great Britain and France prior to American entry into World War I. In 1919 he served on the American Commission to Negotiate Peace. When in 1940 the Morgan house became an incorporated commercial bank and trust company, he became chairman of its executive committee and in 1943 chairman of the board. For a time he owned the New York *Evening Post* and for several years after relinquishing ownership retained its literary supplement which he published as *The Saturday Review of Literature*.

LAMORICIERE, lâ-mô-rê-syâr', Christophe Léon Louis Juchault de, French general: b. Nantes, Feb. 5, 1806; d. Prouzel, Sept. 11, 1865. He entered the engineers in 1828, served in the Algerian campaigns from 1830, and in 1843 became a general of division. He rendered important service at the battle of Isly, Aug. 14, 1844; acted temporarily as governor-general of Algeria, and in 1847 secured the surrender of Abd-el-Kader, thereby terminating the war. Upon his return to France he was elected to the Chamber of Deputies and served as minister of war under General Cavaignac. A bitter opponent of Louis Napoleon, he refused to give allegiance after the coup d'état of Dec. 2, 1851 and was exiled. He became commander of the papal army in the Italian campaign of 1860, but was defeated and forced to surrender his army at the battle of Castelfidardo, Sept. 18, 1860. The remaining years of his life were spent in retirement in France.

LAMOUREUX, lâ-môo-rû', Charles, French violinist and orchestra leader: b. Bordeaux, Sept. 20, 1834; d. Paris, Dec. 21, 1899.

He entered the conservatory at Paris in 1850 and in 1853 became first violin at the opera. He founded the Société de l'Harmonie Sacrée, and gave the first performance in Paris of Handel's *Messiah* in 1873. In 1876 he became leader of the orchestra at the Opéra Comique and in 1881 he inaugurated a series of Wagnerian concerts. He was twice leader of the orchestra at the Paris Opera and his visits to London were the occasion of many successful concerts at Queen's Hall. He was notably successful in his efforts to popularize the music of Wagner.

LAMP, any contrivance which through the formation of its parts affords a means of producing light, and sometimes heat, by the combustion of oils, fats or inflammable fluids, with the aid of a wick, which, by capillary attraction conveys the substance burned to the flame point. By modern adaptation of the word many appliances for producing light by gas or electricity are designated as lamps, and the illustrations of lamp standards that accompany this article show the high pitch of artistic excellence to which they have been brought. The history of the lamp, however, is interesting, especially as the development of the modern oil lamp and of general illumination can be said to date only from about 1840. Man ignorant of fire is unknown; therefore, the use of the burning brand as a torch may be regarded as coeval with the race, and the torch as the progenitor of the succeeding lamp. Considered archaically the primitive lamp was a very simple device. An unworked stone, having a natural concavity, a sea shell, or the skull of an animal, constituted the earliest forms. A bit of moss or a twist of vegetable fiber served as a wick. Fat, grease or fish oil furnished the illuminant. The introduction of the lamp marked the first stage of man's advancement toward civilization, and may, therefore, be appropriately considered as a figure or symbol on the dial of time pointing to the dawn of his intellectual awakening. When, or where, or by what people the first lamps were made cannot now be determined. Recent archaeological discoveries in ruins of the long-buried cities of the Mesopotamian plain, Assyria, have revealed many terra-cotta lamps of a variety of forms, and of good workmanship, that were in common use 7,000 or 8,000 years B.C. It would be an unwarranted assumption to assert that these well-developed creations denote the beginning of the lamp. Stone lamps have been found that are undoubtedly of great antiquity, but this fact alone does not necessarily class them as palaeolithic; they are simply prehistoric, and of an age that cannot be definitely determined. The so-called Stone Age determines so little that is of real chronological value that classifications in archaeology cannot always be wisely made upon data thus furnished. French archaeologists have within a few years recovered from the lakes of Switzerland bronze lamps that were in use by the lake-dwellers at a period late in the lacustrine period. These are without doubt the most ancient metal lamps yet discovered.

Early Examples.—Whether the first emigrants from Asia into ancient Greece found the Pelasgic peoples using lamps, or whether the invaders brought the art of lamp making with them, neither legend nor tradition has left even a mythical answer. In our researches in lamp

archæology we can at the best but work our way backward, from the known to the unknown, from the ascertained facts to that dim, mysterious darkness of remote antiquity where all traces of chronology are lost, and where our conclusions must be largely sustained by deductions drawn from analogical reasoning. The poems ascribed to Homer, 950 B.C., contain all that we know of the manners and customs of early Greek society. He speaks of the "Festival of Lamps," and makes frequent mention of the torch. The Greek and Roman torch was often

ly a terra-cotta, or bronze, lamp-shaped device secured to a staff. The so-called "grease-lamp" of Egypt is without doubt more ancient than the oldest lamp of Greece and the terra-cotta lamps of Babylonia are also thousands of years older. Egypt as a nation was on decline when the history of Greece began. Egyptian records found on clay tablets proclaim with a remoteness of antiquity as yet unterminded. Among the many ancient relics recovered in the ruins of the Babylonian cities were terra-cotta lamps that closely resembled those of early Greece. This similarity of configuration between the earliest examples of the Greek and those of Greek make of a period was perhaps midway between the first millennium, 776 B.C., and the beginning of the Christian era is remarkable. Only the simplest types are represented. A shallow, saucer-shaped oil or fat reservoir being the most primitive of terra-cotta lamps. Then comes the oval shape, with a slight prolongation of the rim into a short, narrow rostrum, or wick support, the formation of a rudimentary handle. Then the oval shape with the reservoir enclosed, and supported by two wick supports. These constitute the types that were essentially common to all Eastern lands. The later Greek and Roman lamps, in terra-cotta and bronze, are remarkable for their ornamentation, and artistically graceful in form. These constitute a division that separates the crude primitive from the finished product.

The earliest terra-cotta lamps were made of one piece, and baked without glazing. Later Greek and Roman terra-cotta lamps were made of two principal parts, the "crater," or oil reservoir, and the "discus," or covering for the reservoir. Each of these parts were joined together after being molded, and then baked. The ornamentations were generally confined to the "discus," and were called the "limbus" or "nasus," or wick support, as well as the "ansa," or handle, were most frequently made separately and carefully attached to the body of the lamp before baking. The "discus" had a small circular opening near the centre through which the lamp could be filled. Many of the better lamps had the maker's name, and often his private mark, stamped on the bottom. Large terra-cotta lamps were frequently made with two, three and sometimes six or even 12 "nases." The lamp with "nasus" for one wick was called a "monomyxos," and that for two wicks a "dimyxos," and so on. The Greek and Roman bronze lamps were made in an almost endless variety of forms, and were often beautiful and artistic to a marked degree. Plain iron lamps were used by the common people at a later period. They were either cast or forged in a single piece, and were mostly ectypes of the more artistic and costly terra-cotta and bronze lamps, but were without decorations.

The study of the ancient lamp maker was devoted alone to the external form of his wares. Grace, beauty and elegance, as expressed in outlines and decorations, were his chief concern. No attempt was made to improve the light. The pale, smoky, flickering flame continued to shed its uncertain light from the massive and costly silver candelabrum of the wealthy just as it had for untold ages from the simple stone and terra-cotta lamps of their ancestors. Etruscan terra-cotta and bronze lamps so closely resembled those of early Greek make that a separate description is not required in this article. The chief characteristic, however, that distinguished the true Etruscan pottery from that of Greece is the strong coloring that was applied to the former. What was true of the art of lamp making in Greece was also true of the rest of the civilized world, for it was more than 17 centuries after the Christian era before any real improvement was introduced in lamp construction.

The Inventive Age.—Prior to 1783 many lamps and illuminating appliances had been introduced, but there was little if any improvement in the light afforded, or marked advancement in the construction or mechanical arrangement of the parts designed to increase the brilliancy of the flame. The first real improvement was the introduction of the flat, woven, ribbon-like wick, and the securing the wick in a close-fitting support. This arrangement permitted only a small surface of the wick to be exposed to the flame, and the wick being narrow the flame came in contact with the centre as readily as the outward parts and thus most of the free carbon was consumed, consequently there was less smoke than in the old style of loose wick. M. Legers of Paris introduced this improvement in 1783. To this was attached for the first time a spur-wheel, which by rotating adjusted the wick, thus regulating the flame. The same year M. Argand, the Swiss chemist, introduced his improvement in burners, which consisted of a tubular wick attached to a tube which extended through the oil reservoir and opened into the base of the lamp, thus affording a means of centre draught, which supplied an abundance of oxygen to the flame and created sufficient heat to consume all of the carbon and so prevented the escaping of smoke. This was truly the beginning of a new era in lamp making, for the art now entered upon what may be designated as "the inventive age of the lamp." Science and invention now came to the aid of the artisan. Principles involving an understanding of the laws of combustion and the science of light were applied to the construction of illuminating devices. The result was more light and better light. Argand's epoch-making invention related wholly to his improved burner. His first lamps were simply huge oil reservoirs with his new burner attached to the top. He used sheet iron chimneys formed with a hood opening over the flame. The use of glass chimneys with the Argand burner came about purely by accident. A workman in attempting to heat a bottle over the flame cracked off the bottom, and because the glass had become too hot for him to hold he momentarily placed it over the burner. The result was surprising; the brilliancy of the flame was not only increased but the light became steady and in every way

superior to that produced with a sheet iron chimney. The brilliancy of the light on the top of the huge reservoir made a wide shadow. To overcome this was a problem that was finally solved by a German lamp-maker, who produced a model in which the burner was secured to the end of a long neck or rostrum, very much like the present so-called German student lamp. The removing of the light away from the great reservoir not only reduced the shadow but afforded a more ready means of supplying the oil to the wick uniformly. In 1800 Carcel introduced his ingenious lamp which was provided with a clock-work device, which operated a small pump, raising the oil from the base of the lamp to the wick-holder, thus keeping the wick uniformly submerged in the oil. This contrivance was too costly to come into general use, and was confined mostly to lamps used in halls and large rooms. Many lamps were offered by makers that were designed to burn crude, heavy whale oil, and others in which lard oil was consumed. Lard oil lamps were inconvenient in cold weather, for the oil would become solid. To overcome this several devices were invented. Perhaps the most successful was the lamp with a copper tube, the upper end of which was between two wick tubes, while the lower end passed through the oil to the bottom of the lamp. Copper being a good conductor of heat, the oil was thus kept in a liquid state while the lamp was burning. For many years lard oil was the only illuminant used in the great lamps of the lighthouses of the world. It was not until after 1880 that burners for lighthouse lamps had been constructed that would satisfactorily consume kerosene oil. Up to about 1800 but few small, portable lamps had been made. Nearly all the appliances so far introduced for domestic illumination were large, so-called, table lamps, and mural lamps. English manufacturers first made small hand lamps of tin, brass and pewter. These were mostly lard or whale oil burners, with a single wick tube. In the whale oil lamps the wick tube was round, in the lard oil lamps the flat, woven ribbon-wick was used, the wick being moved up and down in the lard oil lamps by a spur-wheel. In the whale oil lamps a small aperture in the upper part of the wick tube was provided, through which "a prick" could be inserted by which the wick was pricked up or down. In the large and important field of research and experiment in domestic illumination, American genius and skill very early took a prominent part.

Lamps in America.—Before proceeding to the introduction of a description of early American inventions relating to lamps and lighting appliances, it will be interesting to briefly notice what may be truly designated as the original American lamp. There has never been found among the remains of the mysterious mound-builders of the Western Continent any utensil that could be rightly regarded as a lamp. The North American Indians, who were found inhabiting the country on the arrival of the first Europeans, did not possess a lamp. The pine torch was their only means of artificial illuminating. The one lamp that can claim the distinction of being really American is the stone lamp of the Eskimo. This is usually a shallow vessel of stone, most frequently of soap-stone,

sometimes bone, clay, wood and the skull of an animal is used. The oil of the seal, walrus and whale is burned in these rude lamps, dry moss serving as a wick. These lamps also serve as stoves, for they are used for cooking and warming. Without these simple lamps human life could not be maintained in the inhospitable regions these strange people inhabit.

The first lamps used in the Plymouth Colony were of Dutch make, and were called by the English emigrants Betty lamps (German, *Besser-better*). The few lamps that the Pilgrim fathers brought with them in the *Mayflower* on her memorable voyage were of this class. They are of iron, either forged from a single piece or were cast of gray, coarse iron. The earliest of these were known as the open Betty, or "Slot lamp." Then followed the Betty with a top, one part of which was formed as a hinged lid. The wick support was an angular, half round iron secured to the inside bottom of the lamp. There was an upright handle at the back, to which was attached, by a link, a pointed hook, the point of which extended beyond the crook. This was used to suspend the lamp from the high back of the rush-bottom chair, or the point was thrust into the crevice between the great stones of the side of the open fire-place. The Betty was pear-shaped, flat on the top and bottom. This form was sometimes made in brass, but rarely was any attempt made at ornamentation. These lamps were in use in some parts of the New England colonies as late as 1790. Prior to 1680 all lamps used in the American colonies were imported, mostly from England. In 1680 a tinsmith of Newbury, Mass., began the manufacture of tin Betty lamps. These, after Newburyport was separated from Newbury, became known as Newburyport Bettys. Later these lamps were made in Rivermouth (Portsmouth, N. H.) and were called Portsmouth Bettys. In 1720 a few pewter and brass lamps had been made by small manufacturers at Salem, Mass., and Providence, R. I. These were heavy and extremely inconvenient to be carried about. Among the earliest makers of pewter lamps and candlesticks in the New England colonies was Richard Graves, a pewterer who came from England, where he had learned the trade, or, as it was then called, the art. He came first to Boston, but moved to Salem, Mass., where he long worked at his business, and brought out many fine goods in his line. Henry Shrimpton of Boston was also a maker of fine pewter lamps, and his beautiful lamps and candlesticks graced many of the grand old colonial homes. Among the earliest American experimenters in lamp construction and inventors of improved burners was that marvellous investigator, philosopher, statesman and inventor, Benjamin Franklin (q.v.). Not content with perfecting an improved stove, known as the Franklin heater, he very early turned his attention to the improvement of domestic lamps. When we recall the fact that Franklin's first manual labor was cutting wicks in his father's chandler shop, it is not surprising that we find his versatile mind turning to the subject of improved illuminating appliances. Prior to 1742 candles were in general use in American colonies. The iron Betty lamps were used in a comparatively few families. The shallow saucer-shaped clay cruise introduced from Scot-

land was still used for lighting among the poorer classes, but candles were the chief illuminators. Franklin's first invention consisted in devising two round wick tubes so arranged that, according to his directions given to the workmen who constructed the burner, the distance between the tubes should equal the diameter of one of them. His theory was that the proximity of the two flames created an upward draught that so increased the heat that the liberated carbon was consumed, thus adding to the light and preventing smoke. He observed that the introduction of the third burner, while it consumed a third more oil, and added a third more flame, did not give a corresponding increase in light. Franklin also suggested the improved cotton wick, loosely braided, which afforded a better medium for supplying oil to the flame by capillary attraction. Franklin did not secure patents on his inventions, but allowed manufacturers to freely introduce them, which they did on quite an extensive scale, and small portable lamps of tin and brass with Franklin burners soon became very common.

Another American of note, Benjamin Thompson, better known as Count Rumford (q.v.), in 1789 wrote an exhaustive essay on "The Management of Light in Illumination." He constructed over 100 different lamps in his extended experiments. He invented the photometer to measure the relative intensity of light emitted by different illuminants. He found that the purest white light could be obtained by means of lamps properly constructed, using clarified vegetable or animal oil, at less than one-eighth of the cost for the same degree of light produced by wax candles, and for about half the cost of tallow candles. He invented one burner. In this he constructed a central flat wick tube, with two similarly shaped tubes placed at acute angles on either side of the wick tube, his design being to supply oxygen through the angular tubes impinging on the central tube. This burner did not satisfy him, and its introduction did not become general. In his further experiments he confined himself to the Argand burner, and devoted his attention to the better construction of the lamp proper. His aim was to produce a lamp in which the shadow should be eliminated as much as possible. He invented what was known as the "Astral lamp," which consisted of constructing an oil reservoir in the form of a flat, circular dish with radiating arms attached to the pedestal of the lamp, and securing the burner within the circle. He also introduced what he called the "Balloon Illuminator." This was for use in halls, ballrooms and salons. He also made what he called a "Dining-room Illuminator," and also a table or reading illuminator. All of Count Rumford's investigations and his extended experiments relating to lights and lamps, were carried on while he was in the public service of the Elector of Bavaria, who created him a count as a reward for his valuable services and as a recognition of his great learning and the importance of his researches and inventions.

Hundreds of patents have been granted to American inventors for lamps and lamp burners. One of the earliest patents on record in the United States Patent Office was for a device in which an adaptation was made of Franklin's two-wick tubes by securing them to a per-

forated disc through which the tubes passed. Beneath the disc was a cork through which the tubes also passed, the cork being cemented to the under side of the disc. This could then be fitted into the top of the lamp the same as a cork fits the neck of a bottle. This was mostly applied to glass lamps, which were first introduced in America in 1810. In 1812 one J. Neal secured a patent for a lamp provided with a telescopic sliding cylinder, the wick tubes were secured to the top of the cylinder, being screwed into a collar which formed the upper part of the tube. When the lamp was filled with oil, a float on the bottom of the tube extended the cylinder to its full length. The wicks were long, reaching to the bottom of the cylinder. As the oil was consumed the cylinder was correspondingly lowered, thus keeping the wicks uniformly submerged in the oil as long as any remained in the lamp. These lamps were made in tin, brass and pewter and became quite popular. In 1839 one J. Price of Nashville, Tenn., obtained a patent on an arrangement for burning pine knots. According to the directions the knots were to be cut up into small pieces and inserted into a tube, which had a diameter of about an inch and a half and a base not unlike an ordinary brass candlestick. A spring inside the upright tube was compressed as the pieces of pine knots were forced in. When the tube had been filled an oval cap or cover with a large opening was placed over the top and secured by a bayonet clutch. The spring forced up the wood to be burned through the opening in the cap; as it was burned away the ash fell into a circular receptacle secured on the upright pedestal. A sheet iron chimney with a broad hood partly surrounding the flame was provided as the specification says "to convey the ascending smoke away from the face of the person using the lamp." P. S. Moorhouse obtained a patent in 1830 for a lighting device in which balls of cotton or tow saturated with grease or fat were burned while held by an upright supporting claw secured to a pan base, in which the ash was collected. Between 1843 and 1845 S. Rust secured eight patents on lamps and five on burners. These patents did not introduce any new features, and consisted mostly of the introduction of novelties relating to forms and supposed ornamentation. His inventions in the line of burners did not involve any new features and possessed but little real utility.

The so-called "Solar Lamps," patented in 1843 by the Philadelphia firm of Cornelius & Company, were a great improvement over any table lamp so far introduced. They were constructed to burn lard oil. The burner proper was a modification of Argand's. The wick tube, over which the circular wick closely fitted, extended through the bottom of the oil reservoir, where it was provided with openings for the admission of air. The heat conveyed through the lard oil by the wick tube served to keep the oil in a liquid state in cold weather. The burner was so constructed that the flame was diffused more generally than in other lamps, while the bulb-shaped glass chimney created a hot-air chamber in which all free carbon was consumed. The light was profuse, white and clear. This firm manufactured a large variety of elegant lamps, which were used extensively in the homes of the wealthy. Benkler's lamp, introduced in 1840, had a tube through which air

was admitted to the flame, the angle of the tube being such that an upward movement of air was produced when the oxygen came in contact with the heat, and thus a forced draught was secured which made the light constant and aided greatly in the consumption of smoke. Through the means thus adopted cheap heavy oils could be burned without the offensive smell and excessive smoke produced by cheaper lamps when these low-grade oils were consumed.

Coal Oil and Kerosene Lamps.—About 1845 was introduced in the United States a compound that was known as burning fluid, or, from its inventor's name, Potter's fluid. This was a highly explosive illuminating fluid, composed of a mixture of about three parts of wood alcohol to one of purified oil of turpentine. This was burned in lamps provided with long, slender, tapering brass tubes, secured to a disc that screwed into a collar fitted to the upper part of the lamp. The wick was round, firmly woven cotton, which closely fitted the wick tubes. This was to prevent the escape of the vapor from the fluid. Little thimble-shaped caps, secured by small chains, were provided to cover the end of the wick tubes when the lamp was not in use. This was to prevent the evaporation of the highly volatile burning fluid. Camphene was the trade name of a burning fluid composed of oil of turpentine, purified by being distilled over quick-lime. This fluid was burned in lamps provided with the same class of burners as that described for burning fluid. The highly explosive nature of these dangerous compounds rendered them unpopular for domestic use, and they were soon displaced by the safer and cheaper kerosene oil, which came into general use about 1860. This was first called coal-oil, and in some localities mineral oil, while in others it was known as petroleum oil. Many hundreds of lamps and burners have been invented to use this cheap illuminant. In all successful kerosene burners a glass chimney is necessary. Many attempts have been made to produce a kerosene burner that would afford a clear, brilliant, steady, smokeless flame, without a chimney, but so far no good, practical lamp has been put on the market that successfully accomplishes this much-desired result. A lamp was made and introduced in 1869 that burned a vapor of naphtha without a chimney. While the flame from this device was white and brilliant, the light was flickering, and when moved about emitted annoying smoke. The highly explosive nature of the fluid burned made its common use unsafe, so that the vapor lamp never became popular. What is known as the German student lamp, supplied with an improved Argand burner, and the so-called Rochester lamp, employing another modification of the Argand burner, are the best and most successful kerosene lamps so far introduced. There are hundreds, if not thousands, of different kerosene oil burners attached to an almost endless variety of lamps now on the market. These embrace hand lamps, table lamps, piano lamps and a variety of library and parlor lamps that are remarkably rich in ornamentation and graceful in form and shape, but in the construction designed to assist the combustion of the oil in producing the illumination the same general principles are involved, and with the exception of the smaller hand lamps the original Argand burner principle is adhered

to, with slight modifications and improvements. In the small hand lamps a perforated hood-shaped cap surrounds the wick making a dome-like chamber through which the air drawn from the outside is deflected into the flame, thus supplying the needed oxygen. The flat ribbon wick is used in most of the smaller lamps, the wick being moved up and down by a spur-wheel as before described.

Safety Lamps are lamps so constructed that the danger from the foul explosive air of mines, especially deep coal mines, may be lessened or prevented, by so protecting the flame of the miner's lamp that it will not come in direct contact with the mixed carburetted hydrogen and atmospheric air, which is often present in such quantities as to create an element of great danger. The first safety lamps were called "Steel Mills," and were devices in which small steel wheels, with roughened edges, were rapidly revolved against a flint, securely held by a powerful spring. The sparks thus produced afforded an intermittent light which was sufficient to illuminate the more dangerous parts of the deep mines. But as this lamp necessitated the employment of a boy to revolve the wheel while the miner was engaged in his work, it proved too expensive for economic use. In 1813 Dr Canny in England introduced the first true safety miner's lamp. In his invention he produced a lamp in which the external air was admitted to the burner through a chamber containing water, while the flame was protected by a glass bulb, the product of combustion escaped through perforations in a flat support on which the glass bulb rested. This contrivance was so cumbersome, and so liable to breakage, that it never came into general use. In 1815 George Stephenson and Sir Humphry Davy contrived a safety lamp that, with slight modifications, has continued in use up to the present time. The air to support combustion was admitted to the flame through small openings in the bottom of the lamp, while the flame was protected by a glass, upright cylinder, the top of which was covered with a wire gauze cap. Several forms introducing slight changes from the original Davy lamp have been made. The lamp in which the flame is protected by a wire gauze cylinder in the place of a glass one was a later invention of Sir Humphry Davy. Mackworth's safety lamp was an improvement over the Canny lamp, and introduced features common to that and the Davy lamp. A water chamber was provided through which the external air passed before reaching the flame. Immediately surrounding the flame was a thick glass cylinder and above that a fine wire gauze cylinder, making a continuous protection about the flame. Outside of this was an additional wire gauze cylinder added as a means of protection against breakage. Lamps for jewelers, chemists and laboratory use are in reality miniature furnaces, and are generally provided with wide wick supports in which are large cotton wicks. Alcohol is the most common fluid used for generating heat in these lamps. Painter's lamps are contrivances in which naphtha is burned under pressure, the resulting heat being employed in the removing of old paint from surfaces which it is desired to repaint. Hat lanterns are simply lamps of various forms surrounded by glass globes or cylinders to protect the flame from the wind. Ancient la

terns were provided with transparent protectors made of horn scraped thin to permit the light to be reflected through. The word lantern is a combination of lant-horn, and was employed to express a light which was protected with a transparent horn. Another form of early lantern, now designated by collectors as the "Guy Fawkes lantern," was of tin, perforated with small punctures through which the light shone.

Early hall, or as they were called entry, lanterns were often massive and elegant ground glass globes, ornate and beautiful to a marked degree. Either candles or oil were used as illuminant. They were suspended by chains from the ceiling and a glass smoke protector was provided in those of more elaborate make. See ELECTRIC LIGHTING; GAS ILLUMINATION.

(Consult Norton, C. A. Q., *Light and Lamps of Early England*, in *Connecticut Magazine* (Hartford 1903-); Robins, Frederick William, *Story of the Lamp* (Oxford 1939).

C. A. QUINCY NORTON, M.D.

LAMP, Electric. See ELECTRIC LIGHTING.

LAMPADEDROMY, läm-pä-dēd'rōm-i, or **LAMPADEPHORIA**, -fō'ri-a, an ancient Greek torch race on foot or horseback, held in honor of Prometheus, Athena, Hephaestus, Demeter, Pan, Artemis and other divinities. The races undoubtedly originated in honor of Prometheus. The aim of the contestants was to be first to reach the goal with the torch still burning. The races were held at night, and in some of them the contestants were mounted. The foot races were run either singly, each contestant running the entire course, or in relays, in which case the torch was passed from one runner to another and the winner was the team whose torch first arrived. The extinguishment of the torch prohibited a bearer from continuing in the race. The races were regarded as very important, requiring vigorous physical tests and long training.

LAMPAS, läm-pās, or **LAMPERS**, läm-pēr-z, an inflammation and swelling of the mucous membrane of the hard palate in the roof of a horse's mouth. The swelling is back of the incisor teeth and is due to physiological causes; it usually occurs in young horses and at the time of shedding the teeth. No treatment is necessary although an astringent wash may be used.

LAMPASAS, läm-pās'sās, city, Texas, seat of Lampasas County, 60 miles north-northeast of Austin on a tributary of the Lampasas River, on the Atchison, Topeka, and Santa Fe and the Southern Pacific railroads and at the junction of U.S. highways 281 and 183. Altitude 1,025 feet. It is in an area raising livestock, cotton, grain, and poultry, and is a shipping point for cattle, sheep, wool mohair, turkeys, chickens, and pecans. Mineral springs near the community attract tourists.

Settled about 1854, Lampasas was an early cattle town and suffered frequent Indian raids until 1875, when the Comanches were finally driven from the region. Originally incorporated in 1874, it became a city in 1883. Pop. (1950) 869.

LAMPBLACK, finely divided carbon or soot, produced on a commercial scale by the direct combustion of organic materials that rich in carbon, such as tar, resins, pitch

and petroleum. The combustion is usually carried out in brick furnaces, or in cast-iron vessels, to which a smaller supply of air is admitted than would be required for complete oxidation. The dense smoke that results is led through a series of settling chambers, in which the lampblack is deposited, the finest grade being precipitated in the last chamber. Lampblack so prepared contains about 80 per cent of carbon, the remaining portion consisting of oily and resinous matters, together with moisture and certain inorganic substances, such as ammonium sulphate. The resinous and other organic constituents can be removed by heating to redness in a closed crucible, after which the soot is digested with hydrochloric or sulphuric acid, and washed to remove inorganic constituents.

Lampblack is used chiefly in the manufacture of paints and printers' inks and for these purposes the crude product is sufficiently pure. For the manufacture of Chinese ink ("India ink") the purified soot is preferable. In the German method the soot is deposited on woolen cloths hung in the chambers, from which the pigment is detached by beating. See also BLACKS; CARBON BLACKS.

LAMPER EEL, or **LAMPERN**, a lamprey (q.v.).

LAMPERTI, läm-pēr'tē, **Francesco**, Italian teacher of vocal music: b. Savona, March 11, 1813; d. Como, May 1, 1892. He studied at the conservatory at Milan and for many years was director of the theater at Lodi, where he also engaged in vocal training. From 1850 to 1875 he was professor of vocal music at the Milan Conservatory, after which time he engaged in private instruction. His reputation was worldwide and he numbered among his pupils Sembrich, Campanini, Galli, Albani and many other famous singers. He published several treatises on the training of the voice.

LAMPMAN, lämp'män, **Archibald**, Canadian poet: b. Morpeth, Kent County, Ontario, Nov. 17, 1861; d. Ottawa, Ontario, Feb. 10, 1899. Of United Empire Loyalist descent, he was graduated from Trinity College, Ontario (1882), and after 1883 held an appointment in the Post Office Department at Ottawa. He published two collections of poems, *Among the Millet* (1888), and *Lyrics of Earth* (1893). His *Complete Poems* appeared in 1900.

LAMPRECHT, läm-prékt, **Karl**, German historian: b. Jessen, near Wittenberg, Feb. 25, 1856; d. May 11, 1915. He was educated at Göttingen, Leipzig and Munich and in 1885 became professor of history at Bonn, in 1890 at Marburg and in 1891 was appointed to a similar office at Leipzig, which was admirably equipped for his work. As a teacher he was original in his methods, and to him history meant as much the revelation of sociology as of political events. In 1905 he represented Germany at the Congress of Science held at Saint Louis. He founded in 1882 the *Westdeutsche Zeitschrift für Geschichte und Kunst*. He was the chief exponent of the *Kulturgeschichte* and believed intensely in the superiority of German *kultur*. Shortly before his death he repudiated, with some indignation, the conception of Germany's part in World War I as having been dictated

by the "War Lords," and avowed that in regard to it that Germany was a unit. His writings include 'Beiträge zur Geschichte des französischen Wirtschaftslebens im elten Jahrhundert' (1878); 'Die römische Frage von König Pippin bis auf Kaiser Ludwig den Frommen' (1889); 'Deutsche Geschichte' (13 vols., 1891-1908); 'Zur jüngsten deutschen Vergangenheit' (1901); 'What is History' (1905); 'Americana' (1906).

LAMPRECHT THE PRIEST, a middle high German epic poet of the 12th century: date and place of birth and death unknown. Practically all that is known of his life is that he was called "the Priest" and that he wrote, about 1130, the 'Alexanderlied,' an epic poem, founded on a French poem by Aubry de Besançon, celebrating the life of Alexander the Great. It has been published in several different editions, among them being Vienna (1849), Frankfurt (1850), Halle (1884, 1898).

LAMPREY, an eel-like creature of the group *Cyclostomi* and family *Petromyzonidae*. The anatomical characters are described under *CYCLOSTOMI*. The lampreys feed principally on fishes, to which they attach themselves by their suckorial mouths, and then scrape away the flesh with their rasp-like teeth. There are about 7 genera and 15 species, living mostly in the north temperate zone. Lampreys inhabit both salt and fresh waters, but those of the sea ascend rivers and brooks to deposit their spawn on pebbly shallows, and great numbers die there. Most of them are plainly dark colored, but some of the fluviatile species are bluish or silvery, as the common one (*Ichthyomyzon concolor*), in the Upper Mississippi Valley and Great Lakes, which is about a foot long.

LAMPUSCUS, ancient Greek city of Mysia, Asia Minor, on the Hellespont and opposite Gallipoli. The modern village of Lapsaki is built on its site. The city was colonized by Ionian Greeks, possessed a fine harbor and was celebrated for its wine. It came under Persian rule during the Ionian revolt, but after the battle of Mycale, in 479 B.C., it joined the Athenians. After its defense against Antiochus the Great of Syria in 196 B.C. it became an ally of Rome. Lampusacus was the seat of worship of the nature-god Priapus.

LAMPTON, William James, American journalist: b. Lawrence County, Ohio; d. May 1917. He was educated in public and private schools and at the Ohio Wesleyan University and Marietta College; edited a newspaper at Ashland, Ky. (1887-88); was reporter for the Cincinnati *Times*, writer for the Steubenville *Herald* and the Louisville *Courier-Journal*, editor of the *Merchant Traveler*, Cincinnati, and was on the staff of the *Critic* and the *Evening Star*, Washington, and of the *Detroit Free Press*. He was also, after 1898, a special writer for the New York *Sun* and the New York *Herald*. In March 1910 he was appointed colonel on the staff of Governor Willson of Kentucky. He published 'Yawps and Other Things'; 'Mrs. Brown's Opinions' (1886); 'Confessions of a Married Man'; 'Tame Animals I Have Known' (1912), and 'The Trolley and the Lady' (1908). He was a member of the Poetry Society of America and the Author's League of America.

LAMSDORFF, läms'dórf, or LAMBS-DORF, Vladimir Nikolaevitch, Count, Russian statesman: b. Leningrad, 25 Dec. 1844 (old style); d. 20 March 1907. He entered the Foreign Office in 1866 and was continuously in service until his resignation in 1906. He became Assistant Foreign Minister in 1897 and Foreign Minister in 1900. He was likewise Privy Councillor from 1901; and in 1902 he was Secretary of State to the emperor. He was one of the framers of the Peking Treaty of 1900 which determined the future commercial relations of the two countries and stipulated that China should defray the costs involved in the suppression of the Boxer; and in his official capacity worked earnestly in 1903 to avert the Russo-Japanese War. He was successful in securing an amicable settlement with Great Britain when the Russian fleet by mistake fired on a British fishing fleet off Dogger Bank 25 Oct. 1904. He possessed all the Orders of Russia from 1898.

LAMSON-SCRIBNER, Frank, American botanist: b. Cambridgeport, Mass., 19 April 1851. He was graduated at the Maine State College of Agriculture in 1873; served two years as clerk to the secretary of the Maine State Board of Agriculture; and was an officer of Girard College (1876-84). In 1887 he was made chief of the section of vegetable pathology in the United States Department of Agriculture, and from 1888 to 1894 was professor of botany in the University of Tennessee, and director of the agricultural experiment station there 1890-94; chief of Division of Agrostology, United States Department of Agriculture, 1894-1901, and chief of the Insular Bureau of Agriculture, Philippine Islands, 1901-04. In 1889 he received from the French Minister of Agriculture the cross of the Chevalier du Mérite Agricole. He was in charge of exhibits of the United States Department of Agriculture at various expositions since 1904, including those at Saint Louis (1904), Portland, Ore. (1905), Jamestown (1907), Seattle (1909), Buenos Aires (1910), Turin, Italy (1911), the Dry Farming expositions at Lethbridge, Can. (1912), Tulsa, Okla. (1913), Wichita, Kan. (1914), Denver, Colo. (1915); appointed expert on exhibits by the Secretary of Agriculture (1913); and member of the Government Exhibit Board by the President for the Panama-Pacific International Exposition; director of exhibits for the United States Commission, Rio de Janeiro 1922-23. Among his writings are 'Weeds of Maine' (1869); 'Ornamental and Useful Plants of Maine' (1874); 'Agricultural Grasses of Central Montana' (1883); 'Revision of the North American Melicæ' (1885); 'Grasses of Mountain Meadows and Deer Parks' (1889); 'Philippine Agriculture'; 'Diseases of Plants' (1885-87); and papers on 'Grasses as Soil and Soil Binders,' and on 'Grasses and Foliage Plants,' including descriptions of many new species (1894-1900). He has also published 'The True Grasses,' translated from 'Die natürlichen Pflanzenfamilien' (1890).

LAMY, la'mě, Bernard, French philosopher and author: b. Le Mans, 1640; d. Rouen, Jan. 1715. He studied at the oratory at Le Mans and in 1658 entered that at Paris. From 1671-75 he was professor of philosophy at Sorbonne, and later taught at Grenoble and at Paris.

He was removed from Saumur because of his advocacy of the Cartesian philosophy; and he later had trouble over the publication of one of his books without requisite permission. He thereupon, in 1690, retired to Rouen, where he pursued his literary labors. His works include 'Nouvelles Réflexions sur l'art poétique' (Paris 1668; 2d ed., 1678); 'L'art de parler' (Paris 1670; 8th ed., 1757); 'Entretiens sur les sciences' (Grenoble 1683); 'De Tabernaculo fœderis, de sancta civitate Jerusalem et de Templo ejus,' a work of 30 years (Paris 1720), etc.

LAMY, Etienne Marie Victor, French author: b. Cize, Jura, 2 June 1843. He took his degree in law at the University of Stanislas in 1869, and from 1871-81 he served in the *se* of Deputies. He was elected to the *lemy* in 1905 and in 1913 became its *peral* secretary. His works include 'Le Tiers i, l'Assemblée nationale et la Dissolution' 2); 'Témoins des jours passés' (1909,); 'Au service des idées et des lettres' 9); 'Quelques œuvres et quelques ouvriers' 0, 1913), etc. He died in 1919.

LANARK, Scotland, a parliamentary, royal municipal burgh and the county town of Lanarkshire, 32 miles southeast of Glasgow. It is finely situated in romantic scenery; the *s* of Clyde are near by. The principal *inries* are weaving and shoemaking. Lanark is the scene of some of Wallace's exploits, it has interesting Roman and feudal remains. The race course is the scene of a famous Scottish meeting. New Lanark, about a mile off, was for 28 years (1800-28) the scene here noteworthy social experiments of Robert Owen (q.v.). Pop. of municipal burgh, 6,268.

LANARKSHIRE, an inland county in the northwest of Scotland, bounded on the north by Dumfries and Galloway, east by Lincolnton, Midlothian and Peeblesshire, south by Fife and Perthshire and west by Ayrshire and Renfrewshire. Area, 897 square miles. Holding the place in area of the Scottish counties, it contains one-fourth of the population of the country. It is almost entirely drained by the River Clyde and its affluents, and shows a remarkable diversity of aspect, bleak uplands, fertile orchards, busy coal fields and manufacturing districts. The surface rises toward the north, where the Leadhills reach an altitude of 403 feet. The Upper (or southern) Ward is chiefly composed of hill or moorland; the middle Ward is famous for its orchards and the Lower Ward has rich alluvial lands. Dairy farming is one of the principal agricultural industries. Lead-mining is carried on. It is the principal seat of the iron and coal trade of Scotland, with its numerous dependent industries, about 50 per cent of the coal mined in Scotland is raised in Lanarkshire. For Parliamentary purposes the county contains six divisions. The county town is Lanark (q.v.). Pop., including Glasgow, 1,588,300; exclusive of Glasgow, 1,000,000.

Lanarkshire, which has many interesting Celtic and Roman remains, was in ancient times inhabited by the Damnonii, a Celtic tribe. It formed part of the Saxon kingdom of Strathclyde, which in the 7th century was subdued by the Northumbrian Saxons, when great numbers of the Celts migrated to Wales. The county has stirring associations with the struggle for

Scottish independence; at Langside the fate of Mary, Queen of Scots, was settled by the defeat of her forces by the Regent Moray (1568); the Covenanters defeated Claverhouse at Drumclog in 1679, and were in turn defeated by the Duke of Monmouth at Bothwell Brig in the same year.

LANCASHIRE, lănkă-shēr, county palatine in England, bounded on the north by Cumberland and Westmoreland, on the east by Yorkshire, on the south by Derbyshire and Cheshire and on the west by the Irish Sea. Area, 1,880 square miles. It is somewhat flat toward the shoreline, but elevated in the north and east. Geologically, carboniferous limestone prevails in the north, old red sandstone on the coast. Wheat, oats and potatoes form the principal crops; and among its minerals the principal are coal, slate, paving stone, stoneware and fireclay. The great coal field occupies 400 square miles between the chief rivers, the Ribbles—the dividing line between the northern and southern parts of the county—and the Mersey. Iron is abundant in the Furness district, also famed for its ship-building. Its minerals, and especially its great cotton industry, have given it world-wide fame; and its other manufactures include worsted, wool, silk, machinery, glass and soap. Liverpool and Manchester are the principal cities. The capital is Lancaster. For Parliamentary purposes the county has 23 divisions. After the Norman Conquest, Lancaster became first an earldom and then a duchy, and since the reign of Edward IV it has been a Crown duchy and palatinate. Pop. 4,927,484, of which 4,000,000 are in South Lancashire.

LANCASTER, lăngkăst-ēr, Sir James, English navigator: b. about 1550; d. London, May 1618. He served under Drake against the Armada in the *Edward Bonaventure*. He commanded the same ship in the first English expedition to the East Indies (1591-94). The record of this voyage is one of perilous adventure, in which some Portuguese ships were captured, and a mutiny broke out in his own crew. Of the 200 who had doubled the Cape with him, but 25 returned to England. This voyage led to the founding of the East India Company, of which he was an original director. He captured Pernambuco in Brazil in 1594, and commanded the first fleet of the East India Company (1600-03). On his return home he was knighted. He did much to promote the voyages of Weymouth, Hudson and Baffin, in search of the Northwest Passage to India. The strait leading west from the north of Baffin Bay was in 1616 named Lancaster Sound by Baffin. He was the first of the navigators to use lemon juice as a remedy for scurvy, the virtue of which was afterward entirely forgotten for nearly 200 years. Consult his 'Voyages,' edited by Markham for the Hakluyt Society (London 1877).

LANCASTER Joseph, English educator, the founder of the educational system bearing his name: b. London, 25 Nov. 1778; d. New York, 24 Oct. 1838. Early awakened to religious impressions, he served as a naval volunteer and afterward joined the Society of Friends, and became deeply imbued with the educational needs of the poorer classes. In 1798 he opened a school for children in Southwark,

which he conducted on the Madras system, previously developed by Andrew Bell (q.v.). The principal features of the system were the teaching of the younger pupils by the more advanced students, called monitors, and an elaborate system of mechanical drill, by means of which these young teachers taught large numbers at the same time. Although his schools were opposed by the established church as subversive of its monopoly, he soon found powerful support, and in 1805 was teaching 1,000 children. With the number of his patrons and the amount of subscriptions continuing to increase, he founded a normal school for training teachers in his system.

Lancaster made extensive tours through Great Britain and Ireland, and in 1811 had founded 95 schools, attended by 30,000 children. He was somewhat unbusinesslike and improvident in his habits, became bankrupt, and in 1818 emigrated to America, where schools were founded on his model in New York, Philadelphia, Boston and Baltimore. Afterward he attempted to set up a school in Montreal. His family subsequently moved to Mexico, where his grandchildren, bearing the name Lancaster-Jones, became prominent politically. See also LANCASTERIAN SCHOOLS.

LANCASTER, town, California, in Los Angeles County, about 45 miles north of Los Angeles in the Antelope Valley section of the Mojave Desert, on U.S. Highway 6 and the Southern Pacific Railroad. Located in an irrigated agricultural area, the town is a trading center and manufactures alfalfa meal and concrete pipes. Chief crops are alfalfa, sugar beets, and grain.

Situated in Lancaster is the Antelope Valley Junior College which serves the surrounding region. In 1950 the town was unincorporated. Pop. (1950) 3,594.

LANCASTER, municipal borough, England, a seaport and county town of Lancashire, on the south bank of the Lune River where it becomes tidal 12 miles from the sea, and 20 miles north of Preston. The silting up of the estuary with sand has made the port inaccessible for large vessels, but a dock has been built at Glasson, five miles distant, where ships transfer their cargoes to lighters. Principally an industrial community, Lancaster manufactures linoleum, rayon and other textiles, carpets, and agricultural machinery.

Lancaster is noted for its medieval castle, built by the Normans about 1170 and largely rebuilt in later times, and the 15th-century church of St. Mary's. It also has a magnificent town hall (1909), the gift of Lord Ashton, technical and art schools, and a fine public park.

A Roman station in early times, Lancaster received its first town charter in 1193 and did not become a city until 1937. Gas, water and electric utilities are municipally owned, as are the slaughter houses, baths, markets, and cemeteries. Pop. (1951) 51,650.

LANCASTER, city, Kentucky, seat of Garrard County, 31 miles south of Lexington in the Bluegrass agricultural region, producing burley tobacco, corn, wheat, and hay. Altitude 1,032 feet. It is served by state and federal highways and the Louisville and Nashville Railroad. Industries include the manufacture of work clothing and flour and feed mills. Hooked rugs

are made and sold by women of the community. Among the notable points of interest are Kennedy House where Harriet Beecher Stowe is said to have visited while gathering material for *Uncle Tom's Cabin*, and Gilbert's Creek Meeting House, the first Baptist Church in Kentucky.

The community was named after Lancaster, Pennsylvania, when pioneers from that locality settled here in 1798. Pop. (1950) 2,402.

LANCASTER, town, Massachusetts, in Worcester County on the Nashua River and the Boston and Maine Railroad, 15 miles north-northeast of Worcester. Altitude 277 feet. A residential town with no industries, it is surrounded by a hilly and wooded terrain with farms and orchards producing staple crops, such as corn and wheat, potatoes, hay, and apples. The Old Meeting House, on the Common, was designed in 1816 by Charles Bulfinch and is noted as one of the best examples of his work. Lancaster is also known as the birthplace of Luther Burbank and for the Thayer Bird Museum, which houses a fine collection of North American birds and eggs.

Settled in 1643, Lancaster was incorporated as a town in 1653 and includes South Lancaster Village (pop. 1,462), where the Atlantic Union College (Seventh Day Adventist) is located. The town was several times raided and once destroyed by the Indians. The government is administered by a board of selectmen. Pop. (1950) 3,601.

LANCASTER, town, New Hampshire, seat of Coos County, 115 miles north of Concord on the Connecticut River at the mouth of the Israel River and served by state and federal highways and the Boston and Maine Railroad. Altitude 887 feet. It is an attractive summer resort and winter skiing center. Industries include dairying, lumbering, and the manufacture of furniture, drugs, and chemicals.

The town is administered by a board of three selectmen, one elected each year. The water supply is municipally owned. There is a public library, hospital, and community center, the latter made possible through the Col. F. L. Town endowment fund. Pop. (1950) 3,113.

LANCASTER, village, New York, in Erie County, 8 miles east of Buffalo and 9 miles from the state barge canal on U.S. Highway 26 and the New York Central, the Lackawanna, the Erie, and the Lehigh Valley railroads. Altitude 700 feet. A residential suburb of Buffalo it manufactures steel, wool, and glass products, aircraft parts, and machinery. Other industries include stone quarrying and dairying. A public library service and Como Lake Park, with many recreational facilities, are maintained by the community.

Lancaster was settled in 1810 and received its charter in 1849. Its government is administered by a mayor and council. Pop. (1950) 8,665.

LANCASTER, city, Ohio, seat of Fairfield County, 26 miles southeast of Columbus on the Hocking River, state and federal highways, and the Chesapeake and Ohio and the Pennsylvania railroads. Altitude 844 feet. Lancaster lies at the head of the Hocking Valley which is rich in gas, oil, coal, and clays. In 1890 the town built a plant for the municipal supply of n

gas, which, with the coming of the railroads and the canals, played an important part in the community's industrial development. The principal manufactures of Lancaster are table glassware, dry-cell batteries, gas meters, paper products, oil well machinery, and other machinery products. Two public libraries, 9 public parks, and a radio station serve the community.

In 1800 Ebenezer Zane (1747-1811), an American pioneer, was granted a section of land on the Hocking River and organized a settlement there, which was named New Lancaster because so many of the settlers came from Lancaster, Pennsylvania. The name was changed to Lancaster in 1805. As early as 1806, when the town consisted solely of log cabins, it was the seat of Fairfield County. Incorporated as a village in 1831, it became a city in 1851. Lancaster has a mayor-council form of government. Pop. (1950) 24,180.

LANCASTER, city, Pennsylvania, seat of Lancaster County, 65 miles west of Philadelphia on state and federal highways and the Reading and the Pennsylvania railroads. Transcontinental air service is available at the modern municipal airport. Altitude 369 feet. The county is one of the richest agricultural regions in the United States. Among its leading farm crops are tobacco, wheat, corn, dairy and poultry products. In the city are located the largest stockyards east of Chicago. Lancaster manufactures cork products, linoleum, television tubes, watches, farm machinery, boilers, silk goods, tools, toys, food products, jewelry, and cigars.

Lancaster has a large public library, 3 hospitals, 8 public parks, a tuberculosis sanitarium, a state armory, 2 radio stations, and a television station. It is the seat of Franklin and Marshall College, the Theological Seminary of the Evangelical and Reformed Church, 2 private schools, a watch-making school, and the Thaddeus Stevens Industrial School (for orphan boys), provided by the will of Thaddeus Stevens, who had his home at Lancaster. Among the many points of interest and historical landmarks in and about Lancaster may be mentioned Wheatland, the home of President James Buchanan, and the Old City Hall (1795), a three-story red brick building restored in 1927.

Lancaster and York were named for the two ruling houses opposed to one another in the War of the Roses. They are 24 miles apart and separated by the Susquehanna River. The site of Lancaster was originally settled in 1718 and named Hickory Town, but received its present name 11 years later, when a prominent citizen by the name of John Wright, having been given the privilege of naming the town, selected Lancaster, after his original English home town. The community became a borough in 1742, was incorporated as a city in 1818, and adopted a commission form of government, with a third-class city charter, on Jan. 1, 1926. Pop. (1950) 63,774.

LANCASTER, town, South Carolina, seat of Lancaster County, 21 miles southeast of Rock Hill on state and federal highways and the Southern and the Lancaster and Chester railroads. Altitude 547 feet. It is a shipping and trading center of a farming district growing cotton, tobacco, alfalfa, corn and other grain, and raising livestock. The town has cotton mills, machine

shops, cottonseed oil mill and fertilizer plant, lumber yards, and brick and tile works. The community has a city-manager form of government. Pop. (1950) 7,159.

LANCASTER, city, Wisconsin, seat of Grant County, 13 miles west-northwest of Platteville, on state and federal highways, and the Chicago and Northwestern Railroad. Located in a livestock and dairy farming area, the community manufactures canned foods, beverages, and veterinary remedies. It was settled before 1840 and incorporated in 1878. A mayor and council administer the government. Pop. (1950) 3,266.

LANCASTER, House of, a name given in English history to designate the line of kings—Henry IV, V and VI, immediately descended from John of Gaunt, fourth son of Edward III. Edmund, second son of Henry III, was created Earl of Lancaster and Leicester. His son Thomas added Derby and Lincoln to his titles, became leader of the baronial opposition to Edward II and was beheaded for treason. His grandson was advanced to the dignity of a duke and, dying without male issue, the inheritance fell to his daughter Blanche, heiress of Lancaster, who became the wife of John of Gaunt, who in 1362 was created Duke of Lancaster. His elder brother Lionel was created Duke of Clarence, and his younger brother Edmund of Langley was created first Duke of York (1385). Thus two brothers founded the rival houses of Lancaster and York. Henry IV, son of John of Gaunt, deposed Richard II, son of the Black Prince, usurped the crown, and was succeeded by his son Henry V. Henry VI's long minority and weak rule culminated in the Wars of the Roses (q.v.), the contest being concluded by the union of the two houses in the marriage of Henry VII, the Lancastrian heir, with Elizabeth, eldest daughter and heiress of Edward IV, of the House of York. See also ENGLAND.

LANCASTER SOUND, an outlet of Baffin Bay, connecting it with Barrow Strait. This opening into the Arctic Ocean was discovered by William Baffin in 1616 and was named in honor of Sir James Lancaster but it was first navigated by Sir William Parry in 1819. Only part of it is navigable each season.

LANCASTERIAN SCHOOLS. The founder of these schools was Joseph Lancaster (q.v.) who opened his first school in Southwark, London, in 1798 in order to provide educational facilities for the poor. Operating on a modified plan of the monitorial system of Andrew Bell (q.v.), this school was soon very successful and became the model for several educational experiments in the United States.

In 1805, the legislature of New York incorporated an organization known as "a society for establishing a free school in the city of New York for the education of such poor children as do not belong to or are not provided for by any religious society." One of the prime movers in the organization of this school was DeWitt Clinton. The first school opened by this society was in 1806 and the Lancastrian system was put in operation in that school. The dominant influence in this society was that of the Friends and as Lancaster's school in London was non-sectarian and had been sup-

ported by the Friends it was natural that this society should adopt the Lancaster type of school. The name of the society was later changed to Public School Society and continued its operations for nearly 50 years or until 1853 when it was merged into the public school system of the city under the control of the board of education. More than 60 schools had been established and in each of these during their entire history the Lancastrian system was in operation. While the Lancastrian schools will always be associated with the Public School Society of New York City, such schools were very generally organized in the northern and eastern parts of the United States. He attempted the organization of an institution in Baltimore under his own direction known as Lancastrian Institute. Little is known of this institution except that it was a failure. He also organized a model Lancastrian school in Philadelphia. Outside of New York city these schools were not a factor in public education for a longer period than 20 years and gradually disappeared after 1830. A fine school building administered under the Lancastrian plan was erected at Albany in 1812 and still stands on Eagle street one block south of State street and is owned and occupied by the Albany Medical College.

The most distinguishing feature of the Lancastrian schools was the employment of monitors. One teacher with the assistance of monitors would give instruction to 500 and often to 1,000 pupils. The monitors were chosen from the pupils in the school. The pupils who were regarded by the master as the best students in the advanced classes were selected. They were generally allowed their tuition for the services rendered and sometimes were paid a shilling or two per week. A monitor was charged usually with the instruction of 10 younger pupils. He sat on a high stool or raised seat at the end of a bench on which his pupils were seated. These monitors were very often divided into two classes—general monitors and subordinate monitors. They were called monitor-general of reading, monitor-general of writing, monitor-general of arithmetic. The subordinate monitors were called assistant monitors or simply monitors of reading, monitors of arithmetic, monitors of writing, etc. Each monitor wore a badge or ticket usually made of leather and on this was printed the title of the monitor and his rank.

The curriculum in these schools consisted almost wholly of instruction in reading, writing, arithmetic and morals or religion. Instruction in science and in English grammar was added to the course of study in the schools of New York City during the later years of their existence. The teaching was wholly mechanical. The sole effort of instruction was aimed at imparting information and developing the memory. There was an absolute lack of effort to arouse the child's powers of observation, to stimulate the exercise of his own mental attainments and to develop him into a reasoning, thinking being. Much of the instruction was given by dictation and by the use of formal questions. This was necessary under the monitorial system because the monitors did not possess sufficient education to give independent instruction. Sand tables were used for the children in the younger classes. Boards

containing the letters of the alphabet—small and large—were posted in the schoolroom. The alphabet wheel was also largely used. This was arranged so that a wheel adjusted to a standard might be turned in such a way as to show consecutively the letters of the alphabet. When a letter was exhibited the child from dictation traced the letter in the sand or on a slate. Children who had not received instruction were placed beside those who had received instruction, so that the latter might aid the former. This process of teaching the alphabet was tedious and required from one to two years to enable the child to "learn his letters." This process was termed a "very intellectual method of teaching the alphabet." Writing was of course taught in connection with the reading. When a pupil had learned his alphabet he was promoted to the class in monosyllables and was taught b-a spells ba. Arithmetic was taught under the same general plan. The subject included the four fundamental processes. The pupils were first taught to copy figures from the blackboard. The monitor would write a column of figures on the blackboard and the first pupil would read aloud as, "3 and 4 are seven and 5 are 12 and 7 are nineteen and 6 are twenty-five, put down 5 and carry 2 to the next." If the first pupil made an error in this addition the pupil who discovered it took rank over the one who made the error. As pupils became proficient in arithmetic they were promoted in that subject independently of their proficiency in other subjects. They were promoted in each subject on the same basis. Here was the idea of the modern departmental system of school organization. Teachers of today and even the layman in education will understand the general defects of the Lancastrian system of instruction.

The principles upon which Lancaster founded his schools were sounder than his plan of organization or his systems of instruction. He declared that all children were entitled to an education and that the good of society required that they should be educated. He accordingly held that it was the obligation of a nation to provide school facilities for all children who would not otherwise be accorded such privileges. He also opposed the action of any church in attempting to compel children not members of such church to attend its schools. He regarded such action as the infraction of a most sacred personal right. These fundamental principles of public education were sound and conform to the general principle now accepted wherever public schools are maintained that "education is the function of the state."

Lancaster made extended use of mottoes which were posted conspicuously in the schoolroom, on cards or boards, and which were also made the subject of classroom instruction. Some of these were as follows: "A place for everything and everything in its place." "Let every child at every moment have something to do and a motive for doing it."

One of the first agencies in the country for the training of teachers was the Lancastrian schools. The annual report of 1814 of the society for establishing a free school in New York, states that from its beginning (1806) one of its great objects of interest has been to train teachers. In 1818 Charles Picton, a trained disciple of the Lancastrian system, was

brought from London to take charge of a public school in New York City. The training of teachers which had already received attention was given prominence and the trustees announced that they would gratuitously train teachers for this system in six or eight weeks. Lancaster did not approve this limited training and referred to it as preparing "mush-room teachers." The plan of training teachers in New York City was later improved and the course extended to include more advanced instruction. The work of these schools in training teachers was no more effective than the instruction which the schools provided for the children.

Lancaster was opposed to the rod as a disciplinary agency. His ideas on this subject are represented in the following statement: "The guillotine in France, during the Reign of Terror, and the rod in the hands of the advocates of ignorance, are alike." DeWitt Clinton stated in relation to the discipline of these schools, "The punishments are varied with circumstances, and a judicious system of rewards, calculated to engage the infant mind in the discharge of its duty, forms the keystone which binds together the whole edifice." Rewards were offered for meritorious conduct and fines were imposed for breaches of discipline. These were arranged on an elaborate scale through the issuance of tickets; some of the common modes of punishment were as follows: placing wooden log weighing from three to eight pounds around the pupil's neck; putting wooden shackles on the legs of a pupil and compelling him to walk around the room, putting the hands behind the back and tying them with wooden shackles, tying the legs together, detention after school hours, placing a label on a pupil which specified his offense, compelling a pupil to wear a tin or paper cap or a soldier's coat, giving an indolent boy a cart or a blow. It is suggested in the manual that boys could be rocked in a cradle.

In the year 1818, Lancaster came to the city of New York. He was received as a distinguished guest of honor. He was welcomed on behalf of the city by the recorder and the mayor and on behalf of the State by Governor Clinton. The governor invited him to Albany and there introduced him to the leading men of the State. He then visited the city of Philadelphia and was there received with unusual honor and distinction. From Philadelphia he went to Washington where the House of Representatives passed the following resolution: "That Joseph Lancaster, the friend of learning and of man, be admitted to a seat within the hall."

Clinton gave the Lancasterian system his unqualified approval and through his great influence the system was readily adopted in every city in the State of New York. Clinton said of him, "I recognize in Lancaster the benefactor of the human race. I consider his system as creating a new era in education, as a blessing sent down from heaven to redeem the poor and oppressed of this world from the power and dominion of ignorance." One of the governor's official acts was to recommend the enactment of law authorizing the supervisors of county to raise \$2,000 for the establishment of a monitorial high school in each of the State.

This system did not provide a sound system of public education. It became established in certain parts of the country, notably in New York City, and delayed the establishment of a sound, practicable, efficient system of education in such places for several years. Its adoption not only throughout the United States but in England, Holland and Germany was due largely to the claim of its friends that "one teacher could instruct one thousand pupils." Its trial throughout the world for a period of 25 to 50 years shows the lack of appreciation of a sound, scientific system of education which existed not only in America but abroad in the formative period of our national government.

THOMAS E. FINEGAN,
*Former Superintendent of Public Instruction,
The Commonwealth of Pennsylvania.*

LANCE, George, English painter: b. Dunmow, Essex, 24 March 1802; d. Birkenhead, 18 June 1864. When less than 14 years old he entered the studio of Haydon in London and remained a pupil there for seven years, also studying at the Royal Academy. He began to exhibit in 1824 and is best known as a painter of flowers, fruits and game, but occasionally produced historical and genre work. He exhibited 135 pictures at the British Institution, 48 at the Society of British Artists and 38 at the Royal Academy. His work may be seen in the National Gallery, the South Kensington Museum and the Tate Gallery. Among his pupils were Sir John Gilbert and William Duffield.

LANCE, a weapon consisting of a long shaft, with a sharp point, much used before the invention of firearms and still in use. It was common among the Greeks and Romans. Frederick the Great formed an entire regiment of lancers. The Austrians followed and soon established three regiments. After the partition of Poland, many Poles entered the French service and a body of Polish lancers was established. The war with Russia, in which the efficiency of the lance in the hands of the Cossacks, particularly in 1812, was strikingly manifested, brought this weapon into still more repute, and the Prussians formed three regiments. The French lancers were formed in 1813 to cope with the Cossacks. Almost all the armies of Europe have regiments of lancers: the Cossacks of the Ural, the German Uhlans, the independent cavalry of the French dragoons, the first regiment of each division of Turkish cavalry and the Bengal native cavalry are armed with the lance, as are four Belgian and six British cavalry regiments. This arm is not in use in the United States cavalry. The weapon is from 8 to 11 feet long and is made of oak, bamboo or (in the case of the Uhlans) of tubular steel. It has long been a subject of debate whether the lance or sword is the more effective cavalry weapon; its execution is most deadly in the pursuit of a fleeing enemy.

LANCELET. See AMPHIOXUS.

LANCELOT OF THE LAKE, a name celebrated in the traditions relating to King Arthur or the Round Table. Lancelot was the son of Ban, king of Brucic, and after his father's death was educated by Viviana (the Lady of the Lake). She took him to the court

of King Arthur, to make him one of his knights, and to admit him to the heroes of the Round Table. Arthur with his sword (*Escalibor*) dubbed him knight, and Lancelot subsequently distinguished himself by his great heroism. His love for Guinevere, the wife of Arthur, and his disregard of Morgana, a fairy, and the sister of Arthur, placed the knight in the most dangerous situations, from which, however, he always extricated himself. He finally succeeded to the throne, after having defeated King Claudas, the murderer of his father, but was slain by Mordred, the murderer of Arthur, whom Lancelot wished to punish. In his last moments Viviana appeared and kissed the last breath from the lips of the dying hero, the sole survivor of the Round Table. His remains were deposited near those of Guinevere.

LANCER, a soldier of the European light cavalry, carrying the lance as a weapon. The use of the lance is of mediæval origin although in later European warfare the Cossacks originally used the lance; it was not introduced into regular army regiments until Napoleon made use of it. Lancer regiments have since been incorporated in most European armies. The Prussian regiments so armed are designated Uhlans, while the Cossacks retain their original name with the weapon. There are no lancer regiments in the United States army. The lancer regiments were used effectively in the early stages of the European War, but trench warfare interrupted their usefulness, together with that of other cavalry divisions. The lancer regiments are most useful when the enemy infantry is in retreat, the effect usually being demoralizing.

LANCET-FISH. See **SURGEON**.

LANCET WINDOW, a high and narrow window with an arch acutely pointed, resembling a lancet in form. This form of window structure was characteristic of the first half of the 13th century and remained in use in England and Scotland long after the French had perfected the geometric forms. They were often built double or triple and in some instances more than three windows are used together, as in the case of the Five Sisters at York Minster. The groups at Ely and Salisbury are excellent examples of the double and triple types. In the lancet groups the central arch may be higher although this is not invariable.

LANCEWOOD, the wood of a West Indian tree (*Bocagea virgata*), of small or moderate size, but of great usefulness and value, possessing in a high degree the qualities of toughness and elasticity. It is well adapted for the shafts and poles of light carriages, and for all uses where light, strong, elastic timber is required. Both in strength and elasticity it is considered superior to the best ash. The name is also applied to the trees themselves, as well as to several other trees and their wood.

LANCHOW, lān'chou, China, capital of the province Kansu, on the right bank of the Hoang-ho and near the Great Wall of China. It is one of the most important cities of interior China, due in part to its situation at the junction of the trade routes to Turkestan, Tibet and Mongolia. The streets of the city are paved with stone, although the buildings are chiefly of wood. The important manufactories are those

of woolen and camels' hair goods and ammunition, while a large trade is carried on in silks, silver and jade ornaments, fur, wood-carvings, tin and copper wares, grain, vegetables, fruit and tea. The population is variously estimated around 125,000.

LANCIANI, lan-chiā'nē, **Rodolfo Amedeo**, Italian archæologist: b. Rome, 1 Jan. 1847. He received his education at the Collegio Romano and the University of Rome, and in 1878 was made professor of Roman topography in the latter. He attained celebrity by his investigations among the ruins of Rome, is the author of upward of 400 archæological or historical publications, and was a member of many learned societies and a senator of the kingdom of Italy. In 1887 he gave a course of lectures at Harvard University, afterward published with the title 'Ancient Rome in the Light of Recent Discoveries' (1888). Other works of his are 'L'Itinerario di Einsiedeln e l'Ordine di Beneletto Canonico' (1891); 'Pagan and Christian Rome' (1893); 'The Ruins and Excavations of Ancient Rome' (1897); 'Forma Urbis Romæ' (1893-1901), a map of Ancient Rome in 46 sheets on a scale of 1:1000; 'New Tales of Old Rome' (1901); 'Golden Days of the Renaissance in Rome' (1906); 'Wanderings in the Roman Campagna' (1909); 'Ancient Roman Churches' (1927). Died, 21 May, 1929.

LANCIANO, lan-chiā'nō (ancient *Aux-ANUM*), Italy, city and episcopal see in the province Chièti, eight miles from the Adriatic and 12 miles southeast of Chièti. The city is built upon three hills, two of which are connected by a Roman bridge, and is 984 feet above sea-level. It has an imposing cathedral, with a clock-tower built in 1619. There is a Gothic church erected 1227, and there is a fine rose window, 1362, in the church of the Annunziata. It is the seat of an archbishop, whose palace is built upon the remains of an old Roman theatre. The ancient city was a judicial and civic headquarters under Roman occupation. The modern city has schools, a hospital, gymnasium, library and other progressive institutions. The trade of the city is concerned largely with the products of the surrounding country, silk, wine, oil, fruits and grain, and there are linen and hemp factories. Pop. (commune) 19,917.

LANCRET, lān'krā, **Nicolas**, French painter: b. Paris, 22 Jan. 1660; d. there, 14 Sept. 1743. He studied under D'Ulin and later under Gillot who had taught Watteau. Lancret's style was largely influenced by Watteau, for whom he had a great admiration, and while his productions never equalled those of his model, he did excellent work in the portrayal of the gay scenes of the court under the Regency. More than 80 of his paintings have been engraved and the total of his work is immense. He was admitted to the Academy in 1719 and in 1735 he became a councillor. The National Gallery, London, has four of his paintings, 'The Four Ages of Man'; the British Museum has an excellent series of drawings done in red chalk; there are 28 of his paintings in the royal palaces at Berlin and Potsdam, these being purchased by Frederick the Great; there are six in Petrograd, and numerous others in collections, public and private. Consult d'Argenville, 'Vies des peintres,'

and Ballot de Sovet, 'Éloge de M. Lancret' (1843; new ed., 1874).

LAND, in Political Economy. In economic theory as in social fact, land holds a peculiar position, by which the laws normal to other industrial objects are deflected. Foremost is the fact that, it being an indispensable *locus* for all industry or even social existence, its price or rental in a community where all the land is taken up is non-competitive, a monopoly which is also a *sine qua non*, as would be that of air or water, and consequently is always higher than its productive value justifies, or what is the same thing, men are content to receive a less return on their capital invested in it than in any other object. This is of course aggravated in countries where, as in England before 1832, all political privileges are annexed to it, the richest manufacturer having no vote unless he bought land and became a freholder; less so, but still heavily, in England at present, where it and its tenantry confer great social and political prestige; but most of all in societies like the south of Ireland where there is practically no industry but agriculture, and a footing on the soil at some terms is the one refuge from starvation. Farms there in former days were bid for on occasion at 10 or a dozen times the gross annual produce, because there are no degrees in impossibility, and they could not in any event be deprived of a bare coarse subsistence. But the only countries in which it is on an economic level with other objects are those like America, where there has been an inexhaustible abundance of land to be had at about the cost of surveying and registering title; and here it has been the economic regulator of other prices and wages, which cannot fall below the profit of free agriculture.

The economic discussion over land in England, where freeholds are very difficult to acquire, naturally took the form of an investigation of the phenomena of Rent (q.v.); and an important part of the first economic philosophies was based on a theory of the origin and mutations of the rent charge. According to them it could only exist where there were different grades of soils, and represented the difference in profit of farming better ones over that of farming those just sufficient to make their utilization worth while. In fact, however, even if all soils were alike, rent would still be paid for their hire if the labor and capital could produce more than the rental. Another principle early formulated, differentiating the working of land from other industries, was that of diminishing returns: it was said that labor and capital in any other field produce in exact proportion to their volume, whatever that be,—10 times the investment producing 10 times the return,—whereas upon the land it is manifestly not so; extra labor produces but a small and rapidly dwindling accretion to the product, till it soon ceases to produce any. Here again there was imperfect observation: two plowings or hoeings would not produce double the crop of one, but double the outlay invested in manures or other fertilizers, loads of loam, etc., often produce very much more than a proportionate extra return. The real difference is, that in other industries the extra outlay can be applied in exactly the same channels, in land it must seek different ones.

Land in this sense refers purely to land used

for raising food; where it has other uses, it is subject to the general laws of industry. Land, for instance, on which is located a water-power for manufacturing, or mineral land, if for sale, follows the usual mercantile conditions.

The subject of land belongs under Land Laws; of the single tax, under Taxation; of land nationalization, under Socialism, it being a branch of the question how far it would profit the country to place the entire social machinery under elected instead of self-determined managers; of agrarian difficulties, under the special branches of history concerned—the Roman agrarian contests, for example, shed little light on and are little illumined by the system of peasant distribution in France or the Irish land laws, with its changes from feudal to dual and finally to occupying ownership. See PUBLIC LANDS.

LAND BANKS. See FEDERAL FARM LOAN ACT.

LAND BANKS, Massachusetts. Early in the 18th century Massachusetts paper currency had driven abroad nearly all her coin, broken her credit and demoralized her business, and the failure of the Quebec expedition in 1711 carried the embarrassment to a climax. Encouraged by the success of the South Sea scheme in England, some Boston merchants induced the General Court to make the bills of credit of the province legal tender for debts of seven years previous and three years subsequent. Besides this, a number of notable men, including Peter Faneuil, devised the scheme of a bank whose resources should rest on real estate mortgages, to make loans of its own notes; to encourage subscriptions it was proposed that Harvard College should have \$1,000 a year out of the proceeds. Governor Dudley opposed it strongly; his son, the Attorney-General, memorialized the General Court against it, and the latter forbade them even to print their scheme till they had laid it before the court, which then refused to incorporate it. To ward it off and produce the same result, at Dudley's suggestion a public bank was founded, with a capital of \$250,000 provided by the General Court, to lend bills of credit for five years at 5 per cent, one-fifth to be repaid each year, the whole secured on real estate mortgages. In 1739, with the bad state of the finances increased by the still worse state created by the paper money of Rhode Island, and silver rated at 27 to 1, the project of a land bank was again brought forward. Several hundred persons were to form it; notes were to be issued up to \$750,000, the security being a mortgage on each partner's real estate in proportion to his holding, or sureties also possessed of sufficient estate, and each partner paying 3 per cent on the loans made him, in bills or in kind, at a rate fixed by the directors. The House of Representatives was largely favorable, but Governor Belcher denounced it as tending to fraud, disturbance of order and confusion of business, and he set aside the election of the speaker and nearly half the council for connection with the bank, besides displacing many office holders. Despite this, the company began operations, expecting that the notes would circulate readily. They were mistaken: not over \$300,000 were issued. But in 1741 Parliament not only extended to the colonies an act forbidding the issue of bills not payable in coin at the end of the term, but made the directors liable to the

holders of the bills for their face with interest. As a large part of them had been issued at a discount, the partners (though many had little to lose) were threatened with ruin, and Parliament had to permit relief measures. One of these partners, who lost all his property, was the father of Samuel Adams.

LAND OF BEULAH (Isaiah lxii, 4), the name of Israel when it shall be married. In 'Pilgrim's Progress' Bunyan uses the term to designate a resting place "where the sun shineth night and day" and where the Pilgrims remain until they cross the river Death to the Celestial City.

LAND BOUNTY. See BOUNTIES.

LAND-BRIDGES ACROSS THE OCEANS. One of the most attractive studies in geology is that of the change in form of the continents, and in the relative spaces of ocean, especially since the continents assumed their present general shape, and especially since the beginning of the Age of Mammals, or Tertiary Period,—that geological period which closed with the Glacial Epoch.

It is plain that during this period millions of years long, many changes occurred in the level of the lands of the globe. Sometimes one or the other of the great masses was lifted, until a much larger expanse of land was out of water than before; then again it would sink until the sea overran broad areas. Geologists know this from the fact that they find rocks which were evidently formed under salt water. By their characteristic fossils, and by other marks, they know where these rocks belong in the scale of geological succession, or time; and by plotting them on a map they can show approximately the shape any continent had at some long-past time. Of course this may not be done for any stage you may ask for, but it can for some of them. Thus in the early part of the Tertiary, while both Americas were in much their present condition, only broader in Canada, Europe was an archipelago of large islands, separated from Asia by a broad sea, and the Mediterranean extended over the Saharan deserts, leaving central and southern Africa as an island. All Persia, Syria and Arabia were then under water, so that the cold Arctic Sea flowed through into the Indian Ocean, which must have made the climate of India and East Africa very much cooler than now.

The most interesting feature of these changes, however, is that by which, now and again, the Old World was connected with the New by necks or spaces of land, known as "land-bridges"; especially as these permitted an interchange of plants and animals, giving to us many new ones from the other side of the ocean, including, finally, man himself.

No more fascinating department of natural history exists than the study of the distribution on the earth of living beings, past and present. A striking result of this study is the knowledge that, while the continents and great islands of the southern hemisphere differ from each other, and from the northern hemisphere, in their plants and animals, the several parts of the northern hemisphere are closely similar in this respect. The same families of trees—pines, spruces, cedars, oaks, maples, chestnuts, birches and so on; and the same sorts of animals—quadrupeds, birds, fishes and insects—are

found in Europe and northern Asia as in North America. In fact, many of the living species are virtually identical in all three regions. It is hard to separate the Canadian marten from the Russian sable, our big-horn from the Himalayan argali, our moose and caribou from the elk and reindeer of Norway; and some, like the polar bear, fox and wolf, the raven, golden plover, crossbill, bank-swallow and others, are quite alike in both the Old and the New Worlds. This has been so, judging by the fossils in the various Tertiary strata, ever since the Age of Reptiles.

What is the explanation? None of these animals, save possibly certain birds or fishes, could get across an ocean. They must have been able to travel upon land, and it is from their presence that it seems certain that land-bridges have existed, at various times in the past, between the northern parts of America, and Europe and Asia.

Let us pause here a moment to note what North and South America have to show on this point. South America possesses a fauna which is peculiar to itself. Several large groups there are not represented in any other part of the world, and nearly all its animals in every class, are different from those elsewhere. The fossils show that the same was true in the far past; so that it looks as if that continent has been isolated ever since its life began—only Australia is more self-supplied.

But if South America has always been cut off from the rest of the world (except from North America, at times), where did it get its marsupials? These were numerous there in Tertiary times, and big and little opossums still remain. The only answer is a supposition that at a period when mammals and birds were just beginning to take distinctive form in a world mainly reptilian, both the Australasian islands and South America were attached to an Antarctic continent then far broader than now. An elevation of 10,000 feet above the present level would expose dry land far beyond the Antarctic Circle and include Australia, New Zealand and Patagonia in a South-polar continent; and there is other evidence that such an "Antarctica" existed in Cretaceous and Paleocene times, and that its borders, at least, had a temperate climate.

It is supposed, also, that at the same time, and somewhat later, Brazil and Africa were connected by a ridge, or a chain of islands, since it is hard to account otherwise for the presence of monkeys in South America, which first appeared there in Miocene time, or for certain rodents like those of South Africa. Furthermore, the Atlantic is comparatively shallow and island-studded even now in that narrow part.

Let us return now to North America and its oceanic bridges. These appear, from the data given in the works of Professors Osborn and Scott, to have been repeatedly established and destroyed by alternating elevations and depressions of the land and the sea-bottom, both before and during the Age of Mammals.

At the beginning of the Tertiary Period, continuous land encircled the North Pole. That this would require no very startling change from the present level may be seen by looking at a chart of the northern oceans. This shows

that a broad space extends from Scotland to Greenland, where the water is nowhere more than 1,000 fathoms deep; and that the central part of this is a wide, winding plateau, named Wyville Thomson Ridge, which at the present time comes within 300 or 400 fathoms of the surface. Therefore an uplift of the bottom of the north Atlantic of less than 2,000 feet would extend our coast beyond Greenland and the Banks of Newfoundland, include the British Isles within Europe, drain the Baltic and North seas and connect the two continents by a neck of dry land about 300 miles wide in its narrowest part. There also would appear, probably, a second line of dry land about on the 80th parallel. Both of these, in the warm climate of the early Tertiary Period, would speedily have become covered with vegetation and attract and sustain wandering animals.

On the Pacific side, such a rise would drain nearly the whole of Bering Sea and join Alaska to Siberia by a stretch of mountainous land a thousand miles in breadth. Even 500 feet of uplift would now close Bering Strait.

A moment's thought will show one that a decided, if slow, alteration in the climate of all northern lands must have followed the elevation of these "bridges." The Arctic Sea would then be confined to its own basin, and unable to pour its icy currents into either the Atlantic or the Pacific Ocean. Hence the warm Gulf Stream and its Oriental counterpart, the Japan Current, would, and must, follow a solid coast right around to Europe and western America, respectively, without interference by any cold currents from the north, as at present; and so the whole ocean must have been warmer than now. Hence, we find in the northern coast-rocks of that period remains of tropical sea-animals which could not exist in waters as cold as those of the present day. At the same time solid land extended much farther toward the North Pole than at present, warding off Arctic influences to some extent.

All these circumstances, with others, produced a warm climate in the earlier half of the Tertiary, so that, as the fossil plants of that time show us, tropical conditions prevailed in the United States, and even southern Greenland must have had weather in summer like that of Maryland, for it was clothed with similar plants and hardwood trees.

One may ask: What is the evidence that enables geologists to speak so confidently of the existence of these "land-bridges," since nothing is left of them? It is this:

In the older layers of North American Eocene rocks, all the fossils are of animals peculiar to this continent — families and species which had developed here alone. In the next later layers, however, races of animals suddenly appear, for which no American ancestors can be found, but which are identical with those of the Old World of that time. None of these is much like any present creatures, of course, but the similarity of fossils on both sides of the oceans is so great that it is evident that these animals must then have been able to pass from one continent and colonize the other. The road lay far to the north, but the genial climate kept it open to all sorts of migratory creatures.

There was at this period, also, a broad isthmus between the two Americas, permitting

migration north and south as well as east and west, and it is from that time that we date the arrival of many ancient South American animals, one of which still remains — the opossum. Such a condition for world-wide distribution of plants and animals seems never to have arisen again, although lesser migrations have occurred, for "bridges" were submerged and re-established more than once in the subsequent periods.

Finally the advancing world arrived at that comparatively recent stage, just preceding the Glacial Epoch, which is known as the Pleistocene. All land-connections between Europe and Greenland had then sunk under the waves, leaving only Iceland, the Farøes and the Shetlands as monuments to its former situation; but now the basin of Bering Sea was once more drained and an isthmus of dry land, a thousand miles wide, united Siberia with Alaska, and this remained until the disappearance of the continental ice-cap.

It was by this broad path that America became peopled by a large number of the many kinds of animals which formed the truly grand fauna of our country in the Pleistocene Epoch. Only those who have studied the matter realize how rich and varied this fauna was (as compared with the present paucity) in the genial time just preceding the general glaciation. A large proportion of the animals were immigrants; and, as no bridge had existed across the Atlantic for a long time previous, they must have come over from Asia by way of Alaska.

In this way we obtained most of our northern animals — the bighorn and the mountain goat, the bison, such deer as the moose, caribou and wapiti, the bears, the badgers, otters and other fur-bearers, foxes, wolves and a long list of lesser mammals, birds, etc. None of these have American ancestors. In return, America gave to the Old World the horses and camels, which, originating here, passed over into Asia and on beyond, where they survived, in more favorable circumstances, the extinction that overtook their races here. These two also passed into South America, where all the horses died out, but representatives of the camel family remain in the guanacos, vicuñas and their domesticated races; and there came north the cumbersome ground-sloths and other strange early beasts, and, later, such modern ones as the puma, the porcupine and a few others.

But the strangest incident of this nature is that of the elephants which, from the Miocene onward, wandered over North America and finally penetrated to Patagonia. They developed as species and grew in size until at last they resulted in the huge imperial elephant, the mastodon and the mammoth, the last two of which were killed off here, as in Europe, by primitive men. All of these were, as races, immigrants; but from where? It is only within half a dozen years that this question could be answered. "Appearing," says Dr. Scott, "suddenly in the Miocene of Europe and North America, in which regions nothing was known that could, with any plausibility, be regarded as ancestral to them, they might as well have dropped from the moon for all that could be told concerning their history. The exploration of the Eocene and Oligocene beds of Egypt

has dispelled the mystery, and has shown that Africa was the original home of the group. See also ELEPHANT.

LAND CRABS include a family of true crabs, the Gecarcinidae, and one of land hermit crabs, the Coenobitidae. The true land crabs have a thick, hard, generally smooth shell. The

Land crab

spacious gill chamber is lined with a thick vascular membrane. This tissue serves as an additional respiratory organ and is sufficiently spongy to retain water for a long time helping to keep the gills damp. In the aquatic crabs the corresponding tissue is a thin smooth membrane. Several species of land crabs are found in the coastal areas of all warm climates. Two types are common in the West Indies and southern Florida. The larger of these, *Cardisoma guanhumi*, is popularly known as the great land crab, white land crab, mulatto land crab, juey, tourlourou or guanhumi in various parts of its range. Its shell commonly measures from four to five inches across, while the claws may spread as much as twenty-two inches on large individuals. The smaller type occurs in two closely related species *Gecarcinus ruricola* and *G. lateralis*. Both are popularly known as the black land crab over most of their range although *G. ruricola* also bears the names mountain crab, blue land crab or red tourlourou. The land crabs generally live in holes which they dig in the ground at least until a damp layer of soil has been found. The crabs emerge chiefly at night and in any case avoid the bright sunlight as they die quickly when their gill chambers become dry. They eat mostly vegetable matter but will eat some fresh meat if available. All of the land crabs must go down to the sea during the breeding season as the young crabs must pass their early life in the sea. It is not clear whether the eggs are deposited in the sea or whether the young hatch out at the time the female crab bathes her abdomen in the sea. Land crabs are eaten by native people almost wherever they occur. In some places land crabs have become a serious economic pest. Rice cultivation is greatly impeded in Puerto Rico by the great land crab whose burrows penetrate the clay soil to the porous layers beneath, rapidly draining the paddy fields and wiping out the crop. In Florida as many as ten thousand of these crabs have been reported from a single acre of tomato land where they devour the young plants.

The land hermit crabs belong to two genera, *Coenobita* and *Birgus*. The former is found in the coastal regions of all warm lands; the latter from Zanzibar to the Gilbert Islands. *Birgus*

latro is the famous robber or coconut crab. It is a large form often measuring as much as fifteen inches long. *Coenobita* includes the small land crabs often called soldier crabs in the West Indies. The modification of the respiratory organs for land life differ in these two forms. *Birgus* has a large gill cavity with a very well-developed spongy lining membrane which performs the same function as that of the true land crabs. *Coenobita* does not have so large a gill cavity and the lining membrane is smooth and thin. Unlike the adult *Birgus* whose abdomen has become sufficiently tough so that it can dispense with the sheltering mollusk shell required by other hermit crabs, *Coenobita* has a thin soft abdominal cuticle and usually carries a snail shell about as protection for this vulnerable portion of its anatomy. A network of blood vessels in the abdominal skin, which is kept moist by the protective snail shell, appears to serve as an auxiliary respiratory organ although definitive experiments have not been made. Both crabs must go to the sea for breeding as do the true land crabs. Both genera are omnivorous although they appear to subsist largely on vegetable matter. *Coenobita* may serve as a scavenger and abounds near such sources of abundant food as pig pens and refuse dumps. The popular impression that the coconut crab can open an undamaged coconut or detach coconuts from the tree and drop them upon the ground so as to crack them open is false. The coconut crab is widely used for food by native peoples but *Coenobita* has no economic value.

LAND CREDIT AND LAND CREDIT INSTITUTIONS.

Credit accorded on real estate security is short term if the period is nine years or under, and long term if it is 10 years or over. In the United States, however, long term is understood to begin after five years. Usually the principle of short-term loans is payable in lump at the end of the period, but the principal of long-term loans is reducible to final extinction by partial payments at stated intervals during the period. There are two methods for determining the amount of each of such payments, and also two ways of using them for the reduction and extinction of the debt. The amount may be determined by dividing the principal into equal parts by the number of years, or by splitting it into unequal parts and leaving the larger ones to the latter years so that the partial payments, with interest included, may be as nearly even as possible. Each payment is represented by a promissory note drawing interest from date of the loan.

The common method of computation is to divide the principal by the present value, at interest compounded at the given rate, of a payment of one dollar at the end of each year for the period of the loan. To illustrate, the present value of a 20-year series of such one-dollar payments at 5 per cent compound interest is \$12.46221—a figure that divides 1,000, for instance, into 80.24 equal parts. Hence, this would be about the annual sum that a borrower would have to pay at the end of each year, in order to extinguish a \$1,000 loan at 5 per cent interest within 20 years. If the period is 10 years, he must, by similar reasoning, pay \$129.50, while if it is 50 years he must pay \$54.77 annually.

The borrower's payments determined by this

method are called *annuities*, and the process of paying off a loan by such annuities is called *amortization*.

A variation of this method and process is to require the annuities to be paid at the beginning instead of at the end of each year, and to calculate them accordingly. On a 20-year \$1,000 loan at 5 per cent interest the annuity would then be \$77.94. But inasmuch as the first annuity is deducted from the face of the loan, the borrower would actually get only \$922.06. So if he wished the full \$1,000 he would have to borrow \$1,084.53 and pay a correspondingly larger annuity. When payments are semi-annual, the interest dates are counted instead of the full years, and only one-half of the annual rate is taken; and so also with quarterly payments. Tables published in various languages give the rates by which the annuity can be computed for amortizing a loan of any amount, interest or period up to 100 years. Tables also show annuities in integral figures, as \$25, \$50 or \$75, but inasmuch as they let the period take care of itself, they are objectionable because of the odd number of years and the fractional payments at the end.

The amortization of loans by annuities supposes that out of each annuity there is taken the necessary part to cover interest on the loan and that the remainder is immediately applied to the reduction of the unpaid principal. The effect is the same as that of the instalment plan; and this is one way to use the borrower's payments for the gradual extinction of his debt. The other way is to reckon the principal as remaining at its original amount throughout the period and to place the payments, less interest, into a sinking fund to be credited with interest at a given rate. If this rate is the same in every particular as that of the loan, there will of course be no difference between these two ways in actual results. But the borrower would be at a disadvantage if the sinking fund's yield were lower than that of the loan; and such is often the case in Austrian savings banks, where this sinking-fund plan is much used and the borrower's payments are kept as a deposit account. Loans, whatever be the manner of payment, attain their land-credit character by the mortgage given by the borrower to secure the performance of his contract. The value of the mortgaged property must at least equal the amount of the loan, and the borrower's title to it should preferably be free and unencumbered. The value and title are determined to the lender's satisfaction. Titles may be guaranteed by companies formed for such purpose. In the United States 19 States have enacted laws, embodying features of the Torrens system, for determining the title expeditiously; but in a number of the Western States the foreclosure laws, by reason of the borrower's homestead and other exemptions and redemption rights, do not permit a speedy collection of the debt in the event of default.

Long-term reducible loans are manifestly not suitable for the individual investor. They are practicable only for institutional investors that can issue their own credit instruments against them and thereby effect the immediate recovery of their funds, despite the length of the loan period. These instruments may be either bonds,

like a promissory note, or debentures in the nature of a certificate of indebtedness with or without a date set for payment. Both may be subject to recall at the maker's will and be secured by mortgages held in trust. Debentures, however, usually have no fixed maturity or specific security, but are retired periodically by lot, while the holder's protection is the prior lien of the debentures on all the institution's assets. The length of a loan depends, from the borrower's standpoint, upon the size of the annuity he wishes to pay; from the lender's standpoint, it depends upon the terms and conditions upon which money may be obtained. The institutions for according land credit are either public, semi-public or private. Pure public institutions are those in which government supplies the working funds or the permanent fund, if any, and appoints the executive officers.

In form public institutions are bureaus, commissions or departments of government supported by regular or occasional appropriations, or incorporated bodies with capital or a foundation supplied by government, and with its guaranty, expressed or implied, on any credit instrument they may issue. They are not intended for the average landowner, and they never extend credit without imposing conditions in regard to the person, the rule being that wherever the cash or credit of government is used, the borrower must be in actual need of such help and must swear to apply the loan to the specified object for which it was granted. They were established for breaking up the feudal system, for dividing and allotting large estates, for enabling peasants or workmen to acquire small farms or homes, for promoting interior colonization or settling the public domain, for financing land reclamation, for relieving distress due to war or natural causes, or for meeting problems arising from compulsory military service, absenteeism of landlords, congested population or political emergencies. Government has sometimes subsidized private institutions having such objects. Institutions in which private individuals may hold stock, or participating in profit and loss, and join government in electing the directors and officers are semi-public. Like pure public institutions, they have various forms, and the older ones were authorized by special laws.

The German *landschaften* are a notable type of semi-public institution. There are 23 of these in Germany, and some very loose adaptations of them in Sweden, Denmark, Austria-Hungary and Russia. Formed under special laws enacted at widely different times, they vary greatly in organization and operation. But an outline of the Silesian *landschaft* (created in 1769 and so the oldest of all land-credit institutions) will give a fair idea of the others. A *landschaft* is a district managed by an administration whose chief officers are appointed by government upon nomination of resident landowners enrolled as members. The district includes only lands lying outside the towns and cities and is divided into lesser areas, each with a local administration subordinated to the one just above it. The central organization consists of a president, two vice-presidents, a secretary and a treasurer. The local administrations have a similar organization, except the lowest subdivisions where the sole executive officer is a superintendent.

The organization is associational without capital stock or shares. The voting strength of each member is determined by the number and amount of his mortgages. The voting is done in circles, as the lowest subdivisions are called. Members elect the superintendents and also delegates to sit in convention for selecting the nominees for the other offices. Beyond this members have no voice in the management. They cannot dissolve the landschaft nor alter its structure or purpose since it is not formed under articles of agreement, but was established by legislative act. Acceptance of office is obligatory upon election. Members are bound when duly called upon to perform such duties as caretakers, cultivators or receivers of mortgaged farms taken over upon default of loans. Compensation may or may not be allowed them. All members are borrowers, since nobody joins except applicants for loans, and membership ceases upon repayment of the loan. Any qualified landowner is entitled to admission. If his application be refused by the local owners, he may appeal to the central administration, which in all cases must make the final decision.

The loans of the landschaft must be secured by first mortgage on land worth 50 or 40 per cent more than the loan and stocked with enough equipment and domestic animals to assure a production at least equal to annual dues and taxes. The loans are without any other restriction as to amount, use or purpose. They are always long term and repayable by amortization on the sinking-fund plan. A feature, however, that distinguishes the landschaft from other land-credit institutions is that the loans are made, not in cash, but by an exchange of the borrower's note and mortgage for the landschaft's own debentures. The law prescribes \$1,000 to \$20 as the denominations, and 5 to 3 per cent per annum as the interest rate of these debentures, and gives the borrower the right to select the kind he wants. The annuity consists of the interest on the debentures he selects, plus one-half of 1 per cent of their face; and so the loan and the debentures exactly correspond in amount and interest rate. The borrower undertakes to pay the annuity until his debt is completely extinguished. To this may be added a small charge for expenses during the first 10 or 15 years. Besides the obligatory annuities, the borrower may make voluntary payments as often as he pleases, and tender debentures at par in lieu of cash for all his dues. Defaults are never allowed for longer than six months, since the only money the landschaft has for meeting its obligations on the debentures comes from the loan they represent.

The annuities and other payments by borrowers are placed in the sinking fund as soon as they are received. When the borrower's account therein, after entries of his proportional share of any profit or loss have been made, equals the original amount of his loan, his mortgage is canceled and his membership ceases. This may happen sooner or later than expected. So the period of the loan is somewhat indefinite. No debentures are issued except upon the making of a loan. But the landschaft maintains a bureau for selling them for the borrowers. The sale may be below or above par, and so the interest the borrower

actually pays depends upon the market quotation. With the view of protecting investors, the interest date of the loan is set a few months ahead of the interest date of the debentures, while the membership agreement gives the landschaft a right to instant possession of the mortgaged property in the event of default, or even if it deems its claims in jeopardy. Every six months the landschaft must by lot retire debentures up to the amount of cash on hand in the sinking fund, so as to preserve an exact balance between the outstanding amounts of the loans and debentures. For this reason the debentures are made without any fixed maturity, but are callable at par at the landschaft's will.

This semi-annual retirement and payment of its own debentures and interest coupons, or the acquisition of the same by purchase in open market or through borrowers tending them for their dues, are the only lawful uses that a landschaft may make of its sinking fund. This fund cannot be reinvested in mortgages. If it should become impaired, the landschaft may levy assessments on all borrowers in proportion to the unpaid principal of their loans, in order to make good the deficiency. Hence, since the borrowers are thus collectively liable on the debentures, they are mutually responsible by one another's defaults; and this continues for two years after membership ceases. In most of the landschafts the liability is unlimited, but in a few others it is limited to some percentage or multiple of the mortgage. The landschafts are not profit-making. Their sole object is to exchange their debentures for the less salable note of the borrower, and so enable him to obtain a loan at a lower rate and on easier terms than he could get through his own unaided credit. Operating in this way, the landschafts have need of no other money than what they receive from the borrowers for paying running expenses and interest and for redeeming the debentures. Consequently their only funds are the sinking fund and perhaps a small reserve to guard against contingencies.

Private institutions are those that are owned, financed and managed entirely by individuals without any assistance or intervention of government, except official supervision. With a few exceptions, they are authorized under general laws and not by special acts. There are three kinds: Companies for insuring or guaranteeing titles or mortgages, bond and mortgage companies, and building and loan associations. The first kind, when they confine their business to their distinctive object, serve rather to expedite than to extend credit. When they extend credit, they follow the methods of other private institutions, and so will not be treated separately. Bond and mortgage companies have fixed capital stocks divided into shares, usually paid in.

The various laws of bond and mortgage companies differ widely in detail and at important points, but their first model was the French legislation of 1852, which contains two master clauses. These are capital stock and surplus must be maintained at a safe ratio to bonds or debentures; and bonds or debentures in circulation must represent first liens on real estate of adequate value and never exceed outstanding loans in either

amount or interest rate. The ratio is never more than \$1 to \$20. A part of the capital stock or all of an obligatory reserve is set aside as guaranty fund and kept in liquid investments. The reserve is created out of a portion of the annual earnings. With this exception, a company may invest all its assets, regardless of source, in mortgages and distribute all its profits among shareholders. There is no limit for dividends since the aim is profit. A maximum is sometimes prescribed for capital stock, so as to prevent monopoly, but inasmuch as the capital stock serves not only as a working-fund, but also as a guaranty-fund and must be maintained at the statutory ratio to bonds or debentures, its amount may be increased upon approval or order of the supervising authority.

Generally the companies may extend credit to any class of landowners or on any kind of land designated by the charter or by-laws. The loans may be made for long term payable by annuities, or for short term payable by instalments or in lump, but rarely on the sinking-fund plan. The longest term in France is 75 years. The mortgaged property must have a value 40 or 50 per cent greater than the sum lent upon it and be capable of yielding a durable and certain revenue, which, in the case of long-term loans, must at least equal the borrower's annual dues. If there be a maximum for amount of the loan, it is usually one-tenth of the capital stock. The interest rate must not exceed that borne by the latest issue of bonds or debentures, plus an addition usually limited to one per cent more for costs and profits. Payments on loans are made annually or semi-annually. Perishable parts of the mortgaged property must be insured. The bonds or debentures are issued in series, with dates fixed for payment of principal and interest, but with a provision under which they may be recalled before maturity at a premium; in France prizes are lawful at their redemption. That country also has provided for licensed land-credit companies a special procedure for examining titles.

A building and loan association is an incorporated body with a variable capital; that is to say, a capital which may be increased or decreased by the issuing or canceling of shares, or by payments or withdrawal of payments on such shares. There may be any number of members above the minimum fixed for incorporation. According to the original design, the area of an association was delimited by a radius of a few miles from headquarters, so as to make all operations local. Its powers are to receive members' savings to lend to members for building or acquiring homes. These features stimulate thrift, and for this reason tax exemptions are accorded. The administration consists entirely of members elected by members, the funds all come from members and the facilities are available for members only. The association is, therefore, co-operative.

Shares may be held only by duly admitted members and each entitles the holder to one vote. These are of various kinds. The most common are instalment shares, on which the subscriber makes payments at stated intervals, and investment shares, for which payment may be made in whole or in part at subscription.

A *permanent* association may issue shares at any time. A *serial* one may issue shares only in series, and no new shares may be issued in a series after a dividend has been declared, except to subscribers who pay the book value of such shares. Instalment shares are used for loan transactions. A borrower is required to subscribe to instalment shares in an amount equal to his loan. Consequently he becomes liable to twice the amount of his loan for any losses of the association. A first mortgage is given on the house and lot for which the loan was made, and the shares are pledged as an additional security. Non-borrowing members may subscribe for as few or as many shares of any kind as they please. Payments made by members serve to mature the shares. Each share is credited with its proper portion of the profits. At maturity the shares are canceled. If a member is not indebted to the association, he is given their face value in cash. If he is a borrower, this value offsets his debt and his loan becomes paid and his mortgage is canceled, along with his pledged shares. Pledged shares may not be withdrawn until the loan has been fully paid. But the credits on other shares ordinarily may be withdrawn on 60 days' notice.

By reason of this method the loans of a building and loan association are repayable in instalments on the sinking-fund plan, and may run for 10 or even to 18 years. The funds that an association may have for investment are auctioned off to the highest bidder at a regular meeting or at some meeting specially called for the purpose. The sum which the successful bidder pays in addition to the interest rate is called the premium. The law prescribes no limit for this, while entrance fees and fines for withdrawals or defaults may be charged. Hence, the borrower may be required to pay what would be usury in the case of any other institution or lender. In the United States, there are at least 68 premium plans, 25 plans for distributing profits, 12 withdrawal plans and 7 kinds of shares. So many changes have been made in their original scope that the building and loan associations, under the laws in a number of the States, are no longer true to type. This has been brought about by removing restrictions as to area, making shareholding a mere nominal requirement for borrowers and depositors, and permitting the associations to borrow money, issue bonds, incur liabilities with persons not members, and to finance themselves with funds coming from outside sources.

LAND LEAGUE, an Irish organization founded under the presidency of Charles Stewart Parnell, the Irish Nationalist leader, but inspired and organized by Michael Davitt at a meeting held in Dublin on Oct. 21, 1879. Three successive failures of the Irish crops from 1877 to 1879 led to widespread distress among Irish tenant farmers and peasants. In many cases they were unable to meet their obligations and thousands of evictions took place accompanied by outrages against the landlords. The chief aims of the Land League, formed to meet this situation, were to reduce rents, protect tenants from unfair eviction, and obtain peasant ownership of the land. The situation was greatly aggravated by an abortive prosecution of Davitt and other Land League leaders in November 1879 and the House of Lords' rejection of the Compensation for Disturbance Bill introduced by the Liberals to aid evicted tenants. Parnell, accompanied by John Dillon, son of the rebel John Dillon of 1848, went to the United States to raise relief funds for the people and returned home with £40,000 and many American friends for the cause. Parnell opposed the violent measures to which the desperate peasants often resorted. Instead he, along with other leaders, encouraged the system of boycotting, so named from its first victim, a County Mayo land agent named Capt. Charles C. Boycott. The system proved very effective and the Land League grew in power until 1880 when Parnell and thirteen others were indicted for encouraging peasants not to pay rents. Although they were acquitted the Land League was declared illegal and the Habeas Corpus Act was suspended resulting in the imprisonment of almost two hundred persons without trial. William Gladstone then came to the aid of the Irish with a new land bill in 1881 which improved the position of the tenants. However, when Parnell only met the measure halfway, Gladstone had him imprisoned in Kilmainham with his chief aides. From prison Parnell directed the peasants to pay no rent. The resulting furor on the part of the aroused peasants and increased coercion on the part of the government soon brought matters to a head. The prisoners were released and according to an agreement called the Kilmainham Treaty, Parnell agreed to curb the outrages of the peasants. Thereafter the Land League was suppressed but its principal aims were later realized in George Wyndham's act of 1903 which in effect completed the passage of ownership of land from landlords to tenants.

LAND MANAGEMENT, Bureau of. The Bureau of Land Management, Department of the Interior of the United States, formed in 1946 through consolidation of the General Land Office (1812) and the Grazing Service (1934) is the federal agency accountable to the people for the administration, selective disposal, conservation and management of the vacant public lands. These lands total some 180 million acres in the United States and 290 million acres in Alaska. In addition, it is responsible for leasing the mineral rights on approximately 700 million acres of federally-owned lands and on about 50 million acres of privately-owned lands on which the U.S. government has retained mineral rights.

Specific activities in connection with the management of federal lands are: *Cadastral Surveying*—the identification of land areas. These surveys create land boundaries, identify lands, determine areas, furnish legal descriptions, and establish monuments on the ground. *Range Management*—issues permits, licenses, or leases permitting use of the federal range within grazing districts and vacant public lands for grazing purposes in the Western states. In addition, the Bureau of Land Management, under provision of the National Soil Conservation Act, carries out conservation operations to restore and rehabilitate these range lands. Areas depleted or deteriorating because of past abuses or from fire or flood must be given conservation treatment to restore their maximum productivity. The Bureau of Land Management, in cooperation with stockmen, also conducts a range improvement program which includes weed control, construction of truck trails, corrals, fences and livestock watering facilities.

Forestry.—The Bureau of Land Management is guardian for 28 million acres of timber and woodland in the United States. In addition another 125 million acres of timber and woodland in Alaska and 2½ million acres of heavily forested Oregon and California revested railroad grant lands in western Oregon are managed by this bureau. This program includes the sale of timber, selective cutting, protection of timber against fire, diseases and insects, reforestation and construction of access roads.

Mineral Leasing.—Oil, gas and coal as well as sodium phosphate and potash from public domain mineral lands are leased to the public by the Bureau of Land Management.

Disposal of Land.—The Bureau of Land Management has land in trust for disposal under the homestead, desert land, small tract, public sale, recreational, exchange, and other acts. This land is available in Alaska and in Idaho, Oregon, Washington, Nevada, California, Montana, Wyoming, North Dakota, South Dakota, Nebraska, Kansas, Utah, Colorado, Arizona, New Mexico, Oklahoma, Wisconsin, Michigan, Mississippi, Alabama, Florida, Indiana, Minnesota, Missouri, Arkansas and Louisiana.

Land Records.—The records of disposal of lands under the public land laws as well as survey records are housed by the bureau.

Acting as a guardian for the public interest in the management of the lands of the public domain, the Bureau of Land Management has collected receipts of millions of dollars. During the fiscal year 1951, the Bureau of Land Management collected receipts of \$49,082,331 from the ad-

ministration of resources on public lands, as compared to a Congressional appropriation of \$8,300,530 for the management of those same lands—representing a ratio of nearly \$6 return for every one dollar appropriated.

The Bureau of Land Management has its main office in Washington, D.C., and seven regional offices to expedite service to the people in areas in which they live. The regions are: region 1 serving Washington, Oregon and Idaho; region 2 for California and Nevada; region 3 responsible for the states of Montana, Wyoming, North Dakota, South Dakota, Nebraska and Kansas. Region 4 supervises Utah and Colorado; region 5 Arizona, New Mexico, Texas and Oklahoma. Region 6 is responsible for the management of land available to the public in the area east of the Mississippi and in the tier of states immediately west of the river. Region 7 is in Alaska.

MARION CLAWSON,

Director, Bureau of Land Management.

LAND SNAIL, an air-breathing terrestrial gastropod mollusk. Most land snails have a horny, spiral shell, sometimes more or less calcified, into which the whole animal may be drawn. In the marine snails breathing is accomplished by gills which are derived as projections of the tissue lining the respiratory chamber (the mantle cavity). In the order Pulmonata, to which the great ma-

Land snail.

ajority of land snails belong, these projections have disappeared entirely while the blood vessels of the chamber's walls have greatly increased in number and lie near the inner surface, bringing the blood close to the air which fills the cavity. The lung thus formed has a single opening on the right side under the edge of the shell. This aperture remains closed as long as the concentration of oxygen within the lung is adequate and opens whenever it falls below a certain value. Land snails move about on a single long, narrow, muscular foot. Motion is accomplished by a wave of muscular contraction passing along the foot so that each successive portion is raised and advanced a short distance. The wave system may advance in the same or opposite direction as the motion of the animal. Several different wave systems may be present at the same time and even include systems going in both directions. The common European edible snail has a sort of low and high gearshift. When progressing at a normal pace the wave starts at the front end of the animal and spreads rapidly towards the back. When, however, the snail goes into rapid motion, large waves running in the opposite direction are superimposed upon the small normal waves. Most land snails lack the operculum or hard "door" which closes the aperture of marine snails when the animal has drawn itself within. The radula is a many-toothed, ribbon-like structure which the snails can move back and forth by special muscles and employ like a carpenter's

rasp to shred and tear their food. Vegetable matter makes up most of their food and a few species such as the Giant African Land Snail in the Indo-Pacific are serious pests to agriculture. Some snails also eat insects, earthworms, other snails or almost any available meat. The sexes usually are united in the same individual. Copulation may take place in any one of three ways and occasionally the same individual may exhibit all three at different times. The individuals of a pair may each function as only one sex; or mating may be mutual when each individual acts as both a male and a female at the same time; or, in the third case, self-fertilization may take place. The tough-shelled eggs are laid singly in damp places. Land snails are eaten by insects, birds, and a number of small animals. Particularly interesting among insect snail eaters is a ground beetle the head and fore part of whose body are specially modified into an apparatus for extracting the snail from its shell. Some land snails also serve as intermediate hosts for parasites of higher animals. Especially striking is the trematode genus *Leucochloridium*. In the early developmental stages they live in certain land snails in the northern temperate zones. The parasite develops a large brightly colored pulsating sac in the head or tentacles of the snail host. These sacs apparently make the snail attractive to the birds who then eat the snail and so become infected. Land snails are very widely distributed having been reported from above the snow line in the Himalayas at an altitude of 16,400 feet as well as from the hottest desert region. They require a certain amount of moisture and are most numerous and varied in tropical countries. The details of the geographic variation and distribution have been the basis of some of the classical studies on the principles of animal distribution and evolution. When conditions are unfavorable, as during a dry season or winter in a cold climate, the nonoperculate land snails creep into sheltered places and either seal the aperture with a drumhead-like membrane of dried mucus or cement it to some solid object with the same material. Recoveries after some extraordinary long durations in this inactive state have been reported, including one of eight and a half years. Land snails vary in size from minute animals no larger than a pin head to the giant African land snail whose shell sometimes measures a little over nine inches.

Land snails, mostly members of the genus *Helix*, are extensively used for food by Europeans. The Romans held them in high esteem and special establishments called *cochlearia* were constructed for the purpose of fattening these snails. In France, edible snails are extensively cultivated for market in enclosures called *escargotières*; large numbers are also gathered from the vineyards and sold in the larger towns of southern France and Italy. Considerable quantities of edible snails are imported into the United States. At least two species of these snails, *Helix aspersa* and *Otala lactea* have become established in coastal regions of North America. The former has become a serious garden pest.

LAND SURVEYING. See SURVEYING.

LAND TAX, formerly one of the chief sources of levying an income for government uses, but in modern times constituting generally an inconsiderable part of national incomes. Both the Greeks and Romans taxed upon the estimated yield of land in their earliest taxation, but later developments of wealth gave broader sources of income and the land taxes ceased to occupy the place of prime importance in providing a government income, except where agriculture instead of commerce and industry forms the chief occupation of a country.

Rome returned to the land tax as a source of revenue after the decay of the empire destroyed her commerce; and northern European countries depended upon land taxes almost exclusively in their earlier days. The development of wealth in other forms invariably diverts taxation from the land except where it is required for purposes of social or political development.

The French physiocrats of the 18th century maintained that the entire source of revenue for government uses should be vested in the taxation of land. While these theories have had many adherents, the present economy, based largely on production, makes them practically untenable.

In the United States the laws of the individual states vary, but the general procedure is the assessment at a uniform rate of all property, including land. This general property tax is based on expenses and value. There is no federal taxation of land, direct taxation being left in the hands of the states. As a rule changes in land taxation in the states are at present employed as a means of preventing the land from being held in idleness, thereby retarding the development of the community as a whole.

LAND TORTOISE, any of several terrestrial reptiles of the family Testudinidae, which belongs to the suborder Cryptodira, of the order Testudinata (or Chelonina). The family also includes some aquatic turtles.

Like other turtles in the same suborder, the neck of land tortoises is retractile within the shell, bent in an S-shaped vertical curve. Ordinarily the shell is well developed, being made of flat, bony plates fused with the ribs and vertebrae. Large, horny plates overlies the bony shields.

Land tortoise.

The skull roof is incomplete. A ridge is present on the biting surface of the jaws, and the horny beak has a sharp, cutting edge, often serrated. The nostrils are on a level with the front edge of the eyes. The hind limbs are usually club-shaped, and covered with enlarged, often bony scales. The forelimbs, similarly covered and somewhat flattened, can ordinarily be drawn in to protect the withdrawn head. There are never more than two phalanges in the digits.

Most land tortoises either belong to the genus *Testudo* or are closely allied. Several subgeneric

names were proposed by Lindholm in 1929. *Gopherus* of North America, *Malacochersus*, *Kinixys*, *Acinixys*, and *Homopus* of Africa, and *Pyxis* of Madagascar are turtles closely related to those of the genus *Testudo*, which includes from 40 to 50 species.

Land tortoises are absent from Australia and New Guinea and adjacent islands, but otherwise almost cosmopolitan. They have an ancient lineage, dating back over 50 million years to the Eocene epoch in North America, Eurasia and Africa. Land tortoises were in South America at least as early as the Miocene epoch, 25 million years ago, and from there they reached the Galápagos Islands, where a single species, *Testudo elephantopus*, with several subspecies (some now extinct) evolved to produce individuals of great size on the isolated islands in the archipelago.

Gigantic land tortoises, some of which exceeded 500 pounds in weight, also occur in the islands of the western Indian Ocean, including the Seychelles, Rodriguez, Aldabra, and Mauritius. Over 10 million years ago even larger tortoises, *Colossochelys*, allied to *Testudo* lived in India. Land tortoises devour grass, leaves, and succulent plants, and the giants among them fill the niche occupied by the larger herbivorous mammals, which were absent from the islands inhabited by the larger tortoises.

Land tortoises have been reduced in numbers throughout the world, largely because of man and his activities. Shortly after the discovery of the Galápagos tortoises, ships carried them away by the thousand. Whalers and buccaneers found that such reptiles provided unsurpassed supplies of fresh meat, since the tortoises could be kept alive and unfed for months, packed away in the hold of the ship. Tortoises are eaten in many parts of the world. In Africa the meat of *Testudo* (*Geochelone*) *pardalis* is greatly esteemed by the Hottentots and other natives.

Tortoises lay relatively few eggs; these are usually white, hard-shelled, and nearly spherical. *Gopherus agassizii*, for example, deposits from two to six, but as many as 18 are deposited by *Testudo* (*Geochelone*) *pardalis*. Another African species lays but a single egg at a time, although several may be laid during a season. Eggs, laid in holes dug in the ground, require from 75 days or more (for *Gopherus agassizii*) to as long as a year to incubate.

Growth in land tortoises is commonly slow, but may continue for long periods. A European tortoise, *Testudo graeca*, grew persistently for 39 years. Great ages are attained by individuals of many species. One (*Testudo sumeirei*), brought to Mauritius in 1766 survived until 1918, when it was accidentally killed. Its age at death is estimated to have been between 200 and 250 years, although 152 is the greatest age that can be proved. This exceeds the authenticated maximum for any other backboneed animal.

Arid regions as well as forested areas are inhabited by land tortoises. Some dig burrows. Others remain on the surface, but crawl under ledges or vegetation to hide themselves while resting. Those living in cooler regions hibernate, sometimes in communal "dens," as reported for *Gopherus agassizii* in southwestern Utah. A few species merely bury themselves in the ground. Tortoises living in warmer regions may retire underground (or estivate) during periods of excessively hot or dry weather.

Vision in tortoises is moderately acute, and available evidence indicates that they have the ability to distinguish colors. Their hearing is not defective, although loud noises do not appear to disturb them. Individuals have been taught to respond to special noises.

Courtships are reported for several species. Males may bob the head or bite harmlessly at the shell as a means of stimulating the female prior to copulation. Fights between competing males often occur.

Chairman and Curator, Department of Amphibians and Reptiles, The American Museum of Natural History.

LANDER, Richard Lemon, English African explorer: b. Truro, Feb. 8, 1804; d. Fernando Po, Feb. 6, 1834. He became a domestic servant; in that capacity accompanied Capt. Hugh Clapperton as his servant on his second expedition into the interior of Africa (1825). After Clapperton's death in 1827 he returned to the coast and in 1830 published *Records of Captain Clapperton's Last Expedition to Africa*. In the spring of 1830 he set out with his brother John to explore the course and termination of the Niger, under the auspices of the English government, and from Badagry, near Cape Coast Castle, they proceeded to Boossa on the Niger, and after ascending the river for about 100 miles traced its course downward to the sea and proved that it entered the Bight of Benin by several mouths. They were the first also to discover that it was fed by the Benue. Their journal was published in 1832, entitled *Journal of an Expedition to Explore the Course and Termination of the Niger*, and was translated into several languages. While on a trading expedition in the delta of the Niger, he was wounded by the natives and died soon after. The story of his last journey is told in *Narrative of an Expedition into the Interior of Africa* (London 1835).

LANDER COLLEGE, a small college for women at Greenwood, S. C., founded in 1872 by the Methodist Church. It has a campus of about 75 acres, and the student body (1950-1951) was 173. It offers the B.A. degree, and a degree in music.

LANDES, länd, maritime department of southern France, bounded on the west by the Bay of Biscay. Its area, 3,604 square miles, makes it the second largest department in France, but owing to the fact that three fourths of its territory is occupied by the Landes marsh and pine lands, it is one of the most sparsely-settled districts in the country. The remaining land is highly fertile, however, and the population draws a considerable part of its income from the cork and pine trees of the marsh lands, which yield timber, resinous products, charcoal and cork. There are also sawmills, salt works, iron works, stone quarries, brick and tile works and potteries. Mont-de-Marsan is the capital of the department. Pop. (1946) 248,395.

LANDGRAVE, länd'gräv (German *Landgraf*), a title assumed by certain territorial counts of the German Empire to distinguish them from the inferior counts. There were originally three landgraves, those of Thuringia and of Upper and Lower Alsace, who were princes of the empire. The title was assumed by Louis III of Thuringia about 1130.

LANDING FORCE, an organization of troops especially trained and equipped for amphibious operations, which is assigned the task of landing on a hostile shore against a position or group of positions so located as to permit their seizure by troops operating under a single command.

A landing force is normally a subordinate element of an amphibious task force and is composed of an offensive ground force, with such supporting air, naval and logistical forces as may be required.

LANDING PARTY, a naval organization permanently established within each ship, division, force, and fleet, consisting of headquarters, rifle, machine gun, and other units as prescribed by the force or fleet commander. A landing party is organized to perform limited ground force operations, military police duties during disturbances, and parades and ceremonies, as distinguished from a landing force, which is designed for major ground force operations of a more extensive nature. Landing party organization follows the pattern of Marine Corps infantry units, with each ship providing a designated subordinate unit known as the ship's landing party. Units on the smaller ships are so organized that they may be banded together to form a larger balanced landing party. A ship's landing party is comprised of marines insofar as is practicable; however, bluejackets are used to increase the strength of the landing party to whatever size is necessary to accomplish the assigned mission. The landing of a naval landing party is a recognized procedure in the way of maintaining order where necessary without bringing up a question of war or invasion such as would arise from sending a large force into a country. See also AMPHIBIOUS WARFARE.

LANDINI, län-dé'nè, **Taddeo**, Italian sculptor and architect: b. Florence, c.1517; d. Rome, 1594. Only three of his works survive: the large bas-relief over the principal entrance to the Pauline Chapel of the Vatican, representing Christ washing the feet of the Apostles; a statue of Sixtus V in the Capitoline Museum; and the Fountain of the Tortoises in the Piazza Mattei.

LANDINO, län-dé'nò, **Francesco**, Italian poet and musician: b. Florence, c.1325; d. there, Sept. 2, 1397. Blinded in childhood by smallpox, he devoted himself to music, playing the lute, guitar, flute, and a clavier instrument of his own invention and construction called the "Serena serenorum." His fame as organist of the Church of San Lorenzo earned him the sobriquet of Francesco degli Organi; alluding to his blindness he was also called Francesco Cieco. He is remembered as a leading representative of the 14th century *ars nova*. Many of his madrigals, canzonas and secular songs survive.

LANDIS, **Kenesaw Mountain**, American justice: b. Millville, Ohio, Nov. 20, 1866. He

was educated at the University of Cincinnati and Union College of Law in Chicago. In 1891 he was admitted to the bar and until 1905 he practiced law in Chicago except for a two-year term as private secretary to United States Secretary of State Walter Q. Gresham. President Theodore Roosevelt appointed him United States district judge of the northern district of Illinois in 1905. In 1907 he presided at the trial of the Standard Oil Company of Indiana rebate case, imposing a fine of \$29,240,000. This record-breaking fine was, however, later revoked on appeal. In 1920 he was elected the first commissioner of organized baseball in wake of the Black Sox scandal of 1919. Landis resigned from the Federal bench in 1922 to carry out his duties as commissioner. Until his death on Nov. 25, 1944, he ruled over organized baseball with a firm hand. His honesty and integrity did much to restore the reputation of major league play.

LANDLOCKED SALMONS comprise two species, *Salmo salar sebago*, from eastern Canada and northern New England, and *Salmo salar ouananiche*, a Canadian form most abundant in the Lake St. John area in Quebec. Both are confined to fresh water where they are popular game fish. The Sebago salmon averages five to ten pounds depending on favorable locality and has been known to reach a weight of 35 pounds. The ouananiche, a more northern form, averages two or three pounds and occasionally reaches eight. Spawning migrations typical of salmon do not occur in the case of the ouananiche and in the Sebago are confined to fall journeys upstream. These fish do not die after spawning.

Consult La Monte, F. R., *North American Game Fishes* (New York 1945).

LANDLORD AND TENANT, the legal relationship created by contract wherein the owner of property, known as the landlord or lessor, leases his property, which may be land or buildings, to a person designated as the tenant or lessee. Historically, the relation originated in the practice of infeudation in the Middle Ages, when all holdings were a chain of vassalships, when even kings did homage for portions of their possessions, and no property was held by any but kings, except as vassal to some overlord. The feudal incidents were abolished by the English statute of Quia Emptores in 1290. The modern mercantile relation of lessors and lessees is the creation of statute, judicial decisions and the specific agreements of written contracts. (See LEASE.)

The mutual obligations of the contracting parties in law are natural consequences of the relation. The landlord on his part must provide quiet enjoyment of the premises for the period agreed upon. This includes protection of the tenant from disturbance by the landlord, his other tenants, or anyone claiming a better title to the landlord. However, the landlord is not obliged to protect the tenant from nuisances caused by outsiders. He must make any repairs agreed upon in the lease, if one exists. He must pay all taxes, assessments and interest on any mortgages, if the lease does not assign this obligation to the tenant. He has the legal right to evict a tenant for non-payment of rent or for any other breaches of conditions contracted for. The landlord must comply with existing sanitary regulations. In some states he must also provide heat, hot water, and elevator service

for apartment or apartment hotel occupancy. Rent control and other rights of the landlord were suspended or restricted by emergency legislation during World War II. (See RENT.)

The tenant for his part must pay the rent according to contract. He must use the premises in a proper manner and only for the purposes specified in the lease. If evicted, he is freed from his obligation to pay rent. He may sublet or assign his tenancy unless prohibited from so doing by terms of the lease. He must not commit waste resulting in permanent injury to the property and he is often bound to undertake reasonable repairs necessitated by his occupancy.

Tenancies may be classified according to five general types. (1) A *month-to-month* or *period-to-period tenancy* is one which usually occurs when the tenant has no lease and the rent agreed upon is payable on a monthly, weekly, or quarterly basis. For termination of such tenancy many states require a month's notice or notice corresponding to the period agreed upon for occupancy.

(2) *Tenancy for years* occurs when an express contract is made by the parties. No notice is required to terminate the tenancy which ends when the prescribed term expires. If the tenant remains thereafter the estate becomes a year-to-year or period-to-period tenancy.

(3) *Year-to-year tenancy* is automatically renewed each year unless due notice is given. State law differs on the notice required to terminate such occupancy but it must always be given at the end of a yearly period. At common law six months notice is required.

(4) *Tenancy at will* has no specific term of occupancy set and it may be terminated by the desire of either party. Many states now have statutes requiring notice.

(5) *Tenancy at sufferance* occurs when the tenant remains in possession of the premises after his legal right has expired. He is liable for the rent so long as he remains on the premises and he is not entitled to notice from his landlord. Historically, this type of tenancy protected the tenant from being treated as a trespasser until the landlord either went to court or re-entered his property. Actually, it remains a legal fiction since such tenancy becomes tenancy-at-will if the landlord consents to continued occupancy when the tenant's term has ended.

As implied above tenancy is dissolved when the term contracted for has ended. It may also be terminated by forfeiture when the tenant fails to fulfill his legal obligations, by voluntary surrender, or by a merger of interests.

Bibliography.—Cool, F., *Farm Tenancy* (Durham, N. C. 1937); Rushton, J. N., *Law of Landlord and Tenant* (London 1937); Cool, F., *Landlord and Tenant* (Durham, N. C. 1938); Oppenheim, B., *Look Before You Lease* (New York 1940); Jacobs, A. C., *Cases and Materials on the Law of the Landlord and Tenant* (St. Paul, Minn. 1941); Adkin, B. W., *Handbook of the Law Relating to Landlord and Tenant*, 11th ed. rev. (London 1942)

LANDO or **LANDUS**, pope: r. 913-914. Little is known of this pontiff except that he reigned about six months, was a worthy man, and bestowed a privilege on a church in his native Sabina.

LANDOIS, län-dwä, Hermann, German zoologist: b. Münster, Germany, April 19, 1835; d. there Jan. 29, 1905. He entered the priesthood in 1859, but subsequently devoted himself to natural history studies, and in 1873 he was

appointed professor of zoology at the Academy of Münster and head of the zoological museum. He is the author of 'Sound and Voice Apparatus of Insects' (1867); 'Text-Book of Zoology' (1870); 'Text-Book of Botany' (1872); 'Voices of Animals' (1875).

LANDON, Alfred Mossman, American statesman: b. West Middlesex, Pa., 9 Sept. 1887. He was educated at Marietta (Ohio) Academy and was graduated in law at the University of Kansas in 1908. Disliking the law he never practised but went into banking. This indoor job also proved distasteful and, like his father, he became an independent oil producer. In 1915 he married Margaret Fleming of Oil City, Pa., and settled in Independence, Kans. Mrs. Landon died in 1918 and soon after Mr. Landon enlisted in the Chemical Warfare Service. He had spent five months in training when the armistice came. In 1930 Mr. Landon married Theo Cobb of Topeka, Kans. Early taking an interest in politics, Mr. Landon and his father

ame Roosevelt insurgent Progressives in 2. However, he remained unknown beyond Congressional District (the Third) until 2. In that year he became private secretary Governor Allen with the understanding that would be required to serve but a short time. this position he became known throughout State and soon was acknowledged leader of liberal group called 'the Progressives.' In 24, when the Ku Klux Klan endorsed both Republican and Democratic candidates for vernor, Mr. Landon supported the protest rd candidate who filed as an independent. 1928 Mr. Landon was elected chairman of e Republican State Central Committee. In s capacity he directed the Hoover campaign Kansas and elected Clyde M. Reed as Govnor. Two years later he suffered a slight setck when Harry H. Woodring, a Democrat, on the election for Governor. With John amilton he set about strengthening his Reiblican leadership and becoming the harmony ndidate for Governor in 1932, was elected. In 34 he was re-elected. It is claimed for him at he reduced State taxes and balanced the dget. He upheld the State prohibition amendent in the campaign of 1934. By 1935 his riends began to advance his name for the epublican nomination for the Presidency in 936. Adroitly groups of delegates were gartered in the spring of 1936 and when the Republicans met in Cleveland in June he was nominated on the first ballot with Frank Knox of Illinois as his running mate. His speech 23 July accepting the nomination was in large part an indorsement of the Cleveland platform. In the election of 3 Nov. 1936 he carried only Maine and Vermont with a combined total of 8 electoral votes.

LANDOR, A. Henry Savage, English explorer: b. Florence, 1865; d. there, 28 Dec. 1924. A grandson of Walter Savage Landor (q.v.), he was educated at Florence and in Paris. He spent many years in travel, visiting in Korea, China, Japan, India, Nepal, Tibet, South Mongolia, Persia, Beluchistan, the Philippines, Azore and Sulu islands, and in Australia, America and northern Africa. He was the first white man to reach the sources of the Brahmaputra River and established their exact position (Tibet 1897); and was also the first

white man to explore Central Mindanao Island there discovering the Mansakas ("white tribe"). He was with the allied troops on their march to Peking in 1900, and was the first Anglo-Saxon to enter Lhasa, the Forbidden City. He held the world's record in mountaineering. Mr. Landor declared the River of Doubt, which Theodore Roosevelt claimed to have discovered in South America, to have no existence. He served as a dispatch rider during the European War. Among his writings are 'Alone with the Hairy Ainu'; 'Corea, or the Land of the Morning Calm'; 'A Journey to the Sacred Mountains of Siao-on-tai-shan'; 'China and the Allies' (1901); 'In the Forbidden Land' (1898); 'Across Coveted Lands' (1902); 'The Gems of the East' (1904); 'Tibet and Nepal' (1905); 'Across Widest Africa' (1908); 'The Americans in Panama' (1910); 'An Explorer's Adventures in Tibet' (1910); 'Mysterious South America' (1914).

LANDOR, Walter Savage, English poet and author of prose dialogues: b. Warwick, England, 30 Jan. 1775; d. Florence, Italy, 17 Sept. 1864. The literary life of Landor is among the longest in the history of letters; his first book, 'The Poems of Walter Savage Landor,' appeared in 1795; his last work, 'Heroic Idyls,' came out in 1863. He was the eldest son of Dr. Landor and his second wife, Elizabeth Savage, both of ancient families. As a boy Landor showed great love of reading, was fond of trees and flowers and was known for his physical strength and fiery temper. At school near home and at Rugby, which he entered at 10, he was an excellent Latin scholar, and his rebellion against the somewhat arbitrary dictum of his tutor regarding a Latin quantity was the cause of his rustication in his sixteenth year. Two years later he entered Trinity College, Oxford, where he was known for his sympathies with republican government and whence he was expelled the following year for a boyish freak. This led to a quarrel with his father, and in 1794 he left home. For the next 10 years he lived a somewhat nomadic life, fluctuating between London and Tenby, Wales, with short periods of residence in Bath and other intervening cities, and trying his hand at journalism and poetry. In the former field he wrote rather intemperate articles for the *Courier* against the Tory government then in power; in the latter he did some of his best work. Besides 'The Poems of Walter Savage Landor' already mentioned, there appeared in 1798 his long and vague, but often musical, poem, 'Cebir,' and four years later 'Poetry by the Author of Cebir.' The literary influence to which he was at this time most subject was Milton.

On the death of his father in 1805, Landor succeeded to a goodly property, and began to look about for a country place. Finally in 1809 he bought a large estate at Llanthony in Wales, which he conducted in so high-spirited and impractical a way that in five years he sunk £70,000 in it and was obliged to give it over to trustees, who made it yield a sufficient income to support him elsewhere. Meanwhile, in 1808, he had with characteristic enthusiasm enlisted with a company of volunteers in the war for Spanish liberty, but after a few months in Spain returned disgusted with the pusillani-

mousness of the leaders. With equal impetuosity he had, in 1809, married Miss Julia Thullier, a young girl 18 years his junior, whom he met at a dance in Bath. Owing to his unevenness of temper and to the commonplaceness of her mind, the marriage proved, in many ways, to be an unhappy one. In a fit of anger, he went to France without her, in 1814, though they had planned the journey together. During this period he published several books, of which the most important is *Simonidea*, a volume of elegiac verses (1806), some of his Latin poems, *Idyllia Heroica* (1810), and the tragedy *Count Julian* (1812).

Settling first in Tours, Landor was there joined the following year by his wife, and the two then went to Italy. For three years they lived at Como and later in various Italian cities, until, in 1821, the Landors made Florence their home. Here they were for eight years, and here Landor, who had done comparatively little literary work except for the finishing of *Idyllia Heroica* (1820), wrote the books most intimately associated with his name, the *Imaginary Conversations*. The first of these appeared in two volumes in 1824; this was followed by a third in 1828 and by the fourth and fifth in 1829. Altogether the number of conversations was about 80, which was about doubled during the rest of Landor's life. Though not in any sense popular, they were welcomed by the men of letters of the time. In general they express Landor's reflections and feelings on subjects of high importance. Colvin, in his life of Landor, divides them into two classes, the dramatic, represented by the excellent *Leofric and Godiva*, and the reflective to which type the majority conform; but in a strict sense none are dramatic, for the reason that Landor rarely expresses more than his own emotion, and though this feeling is often high and noble, it is not to any notable degree historically accurate. The reflective dialogues express Landor's fine thoughts on a great variety of subjects, the character of which is represented by the galaxy of famous men who serve as his mouthpiece. All in all, the *Conversations* are among the best examples of restrained, polished, classic style that we possess.

In 1829, Landor removed to Fiesole and here, among other works, he wrote *The Citation and Examination of William Shakespeare*, published in 1834. The book is one of his longer pieces but is not so successful as the *Conversations* because of its rather labored humor. Nor is it so good as the two succeeding pieces, which Landor planned or wrote in Italy and published after his return to England in 1835. *Pericles and Aspasia* (1836), his longest single work, is commonly regarded as his most finished production, in regard to beauty of thought and finish of expression. Scarcely, if at all, inferior, however, is the *Pentameron*, the record of a five-days' visit of Petrarch with Boccaccio, a book which contains some of Landor's most mature criticism, as well as the most charming of his descriptive passages, the narrative of Ser Francisco's visit to church. It is on these perhaps as much as on the more miscellaneous *Conversations* that Landor's fame chiefly rests, though the latter by reason of their earlier appearance and the novelty of their form are more commonly coupled with Landor's name.

Landor's work after 1837 is comparatively unimportant, and except for some articles to Leigh Hunt's *Monthly Repository*, a satire, and some *Hellenics*, supplies little new in type. The

most conspicuous volumes were *Last Fruit of an Old Tree* (1853), containing conversations and miscellaneous work, *Dry Sticks, Fagoted by W. S. Landor* (1858), and *Heroic Idylls* (1863).

Criticism is in substantial agreement that Landor occupies a high but not a pre-eminent place in 19th century letters. The excessively cultivated nature of his subjects, the comparative scantiness, and restraint of his production, and the fact that his style is conspicuous for rhetorical graces rather than for natural warmth or broad sympathy, keep him from attaining the highest position either as a poet or as a prose writer, but as the master of polished prose and the writer of isolated passages he has few superiors.

Bibliography.—The standard life is that by John Forster, 2 vols. (1869), now forming the first volume of the standard edition of the works, 8 vols. (1876). Sidney Colvin's life in the *English Men of Letters* is good; it supplies a good list of authorities on Landor.

WILLIAM BREWSTER,
Professor Emeritus of English, Columbia University.

LANDOUZY, län-dōō-zē', Louis (Joseph Théophile), French physician: b. Reims, March 27, 1845; d. Paris, May 11, 1917. He was educated at Reims and at the Paris Medical School, and was graduated there in 1876. In 1880 he was appointed to the Faculty of Medicine; professor of therapeutics, 1893; professor of clinical medicine, 1901; dean, 1901-1917. He became a member of the Academy of Medicine in 1894, and of the Academy of Sciences in 1913. Landouzy is known for his researches in nervous diseases, serums, and syphilis, but especially for his work in tuberculosis. Named for him are Landouzy's disease (spirochetal jaundice), Landouzy-Déjérine atrophy (facioscapulohumeral atrophy—with Joseph Jules Déjérine, 1849-1917), Landouzy's sciatica (neuralgia of the sciatic nerve), Landouzy's purpura, and the Landouzy-Grasset law (with Joseph Grasset, 1849-1918) which states that in lesions of a single cerebral hemisphere the head turns toward the side of the affected muscles if there is spasticity; if there is paralysis, toward the side of the cerebral lesion.

LANDOWSKA, län-dōf'skā, Wanda, Polish musician: b. Warsaw, July 5, 1877. She was trained as a pianist at the Warsaw Conservatory and in Berlin. In 1900 she went to Paris and subsequently became a well-known concert pianist. Her interest in the music of the 16th to 18th centuries, however, led her to conclude that these works should be performed, not on the piano as was customary, but on the harpsichord for which they were originally intended. The campaign for repopularizing the instrument, which she then conducted, led to the establishment in 1925 of her school: L'École de Musique Ancienne, at Saint-Leu-la-Forêt, near Paris. The *Concert Champêtre* (1928) by Francis Poulenc and Manuel de Falla's Concerto for harpsichord (1923-1926) were composed especially for her. In 1940, however, she was forced by the threatened German occupation to leave France, and moved to the United States, where she became known not only for her recitals, but also for her many recordings. To her is largely due the modern revival of interest in the harpsichord. Among her writings is *La musique ancienne* (1908; translated as *Music the Past*, New York 1924).

LANDRAIL. See **CRABE**.

LANDRETH, Burnet, American agriculturist: b. Philadelphia, Dec. 30, 1842; d. Bristol, Pa., Dec. 2, 1928. He was educated at the Polytechnic College, Philadelphia, was captain of infantry during the Civil War, serving in the Army of the Potomac, and after the war period devoted himself to the promotion of higher agricultural and allied interests in many important fields of service. He was chief of the Bureau of Agriculture at the Centennial Exhibition, director-in-chief of the American Exhibition in London and was a member of many American scientific societies; also held honorary membership in similar bodies in European countries, in India and in Japan; and was Chevalier and Officier du Mérite Agricole de France. He founded and was president of the Association of Centenary Firms of the United States and was head of the seed-house of D. Landreth & Sons, established in 1784 in Philadelphia. He published several works on agricultural subjects.

LANDRETH, David, American agriculturist: b. Philadelphia, Sept. 15, 1802; d. Bristol, Pa., Feb. 22, 1880. He was privately educated and joined his father in the seed and nursery business, devoting himself to matters of public interest in agricultural and horticultural lines after he became head of the firm. He was one of the founders of the Pennsylvania Horticultural Society in 1827 and acted as its corresponding secretary in 1828-1836. He was president of the Philadelphia Society for the Promotion of Agriculture and established the *Illustrated Floral Magazine* in 1832. He wrote numerous articles on agricultural and horticultural subjects and edited with Addison Johnson's *Dictionary of Modern Gardening* (Philadelphia 1847).

LANDRY, Auguste Charles Philippe Robert, Canadian author and statesman: b. Quebec, Jan. 15, 1846; d. Dec. 20, 1919. He was graduated from Laval University in 1866; took a course in agricultural science at the College of Sainte Anne and devoted himself to farming. He served in the militia and rose to the rank of lieutenant colonel. In politics he was allied with the Conservatives; he was a member of the Quebec Assembly (1875-1876); was elected to the Canadian House of Commons in 1878, where he served till 1887, when he was defeated at the general election; in 1892 he was called to the Senate. He became president of the Quebec Exhibition Company in 1894, was a member of several agricultural societies and was elected president of the Council of Agriculture in 1896. He wrote *Traité populaire d'agriculture théorique et pratique* (1878); *L'église et l'état* (1883); and numerous papers on political and scientific subjects.

LANDS, Public. See PUBLIC LANDS.

LANDS END, promontory, England (also **LAND'S END**; the ancient **BOLERIUM** or **BEL-LETERIUM**), in Cornwall; the most westerly point in England. It is composed of granite, the face of which is upwards of 60 feet high, covered with turf. The approach from the sea is blocked by a string of rocky reefs, on one of which, Carn Bras, is Longships Lighthouse (built 1793), about a mile offshore.

LANDSBERG AM LECH, länts'bërk äm lëk', commune, Germany, in Bavaria in the dis-

trict (Kreis) of Upper Bavaria (Oberbayern), 34 miles west of Munich; on the Lech River, an affluent of the Danube. There are several churches, notably the 15th-century Liebfrauenkirche and the 18th-century Jesuitenkirche, and a fine town hall which dates from the 17th century. Its medieval fortress has served as a prison in more modern times and was the place where Adolf Hitler was imprisoned after the failure of the so-called Munich Beer Hall putsch of 1923. Here, also, he wrote most of *Mein Kampf*. Following World War II, the fortress was the scene of the executions of several of Hitler's followers. Industries of Landsberg include beer, leather, cartons, and farm machinery. Pop. (1946) 11,917.

LANDSCAPE ARCHITECTURE.

"Landscape architecture is primarily a fine art, and as such its most important function is to create and preserve beauty in the surroundings of human habitations and in the broader natural scenery of the country; but it is also concerned with promoting the comfort, convenience and health of urban populations, which have scanty access to rural scenery, and urgently need to have their hurrying, workaday lives refreshed and calmed by the beautiful and reposeful sights and sounds which nature, aided by the landscape art, can abundantly provide" (C. W. Eliot, 1910).

The changing of the landscape by man to fit his needs for more attractive surroundings and for better economic use has been carried on by him since earliest times. This development of the land has kept pace with the rise and fall of various civilizations down to the present. In our time the profession of landscape architecture is a recognized part of our civilization although it is known by various names, including site planning, land planning, landscape engineering, landscape design, and landscaping. In general, the more competent of the practitioners use the term landscape architecture for their work while those who prefer, for various reasons, to work on a commercial basis are more likely to use the term landscaping or landscape gardening. While civil engineering plays a part in the creative work of the landscape architect, it must be remembered that engineering itself does not deal with aesthetics and is therefore merely one of the several means to the end in view. This adaptation of the landscape to human use in such a manner that the resulting effects will be pleasant to look upon, at the same time producing the most satisfactory uses of the area from the social as well as the economic basis, necessitates, in many cases, some relation to architecture and its forms and types of design. The landscape architect seeks three-dimensional compositions which are attractive; hence the consideration of building forms and masses becomes evident. But the style and type of building changes, not only with the long periods of development by various peoples, but also with the social and economic growth of a comparatively few decades. The development in the use of concrete, steel, and glass has produced a new style of building design since 1900, and of domestic architecture even more recently. This style may seem incongruous in some of the former landscape compositions. As of the middle of the 20th century, all classic detail, along with the symmetrical design of the small outdoor areas adjacent to the house, is not "fashionable," and the pendulum of taste has swung far to the other extremes, with a close analogy to the Romantic

style of the middle of the 18th century, even in communities of fairly dense population. Much has been written on the merits and the faults of the various types of landscape design. The landscape architect selects that type which best suits the social and economic requirements of the problem, the topography, and the climate. The basic problems the designer tries to solve are: (1) the use to be made of the area; (2) the climate; (3) the type of landscape prevalent in the region; (4) the topography. The design requirements for a state reservation or for a national park would not be expected to fit those of a city park or small recreation area, nor would the design elements looked for in a college campus be the same as those for a land subdivision or public housing scheme, though each might accommodate approximately the same number of persons.

This changing of the earth's surface by man so as to give him aesthetic pleasure as well as economic results dates back to early civilizations in Asia and Europe. Records exist showing that what we today call landscape design was well

This demand for designers skilled in the knowledge of ground forms and vegetation, as well as in matters of architectural composition and the problems of engineering, resulted in the rise of the separate profession—landscape architecture—because the materials and techniques of this field are not sufficiently covered by those of architecture or engineering, and are quite as difficult to master within an ordinary lifetime.

Landscape architecture requires of its practitioner divers abilities, the aesthetic appreciation and the creative power of the artist, together with the executive skill of the businessman; he must have knowledge of architecture, engineering, forestry, horticulture, and of the elements of geology as well. The materials of his art include ground forms, structures in their relation to landscape, vegetation, and the social and economic factors influencing land use for human enjoyment. He cannot be confident that his design is possible of execution or that it will be satisfactory in the end unless he possesses an accurate firsthand knowledge of the ground forms, the vegetation, and the structures; from all of these he must choose the

understood and practiced over three thousand years ago. These examples were created in the geometric, symmetrical or "formal" manner and gave satisfaction not only through the aesthetic effects produced but also because they indicated that man had overcome stubborn natural conditions; the changes in the landscape obviously were man-made. This desire of man to impress his will upon natural surroundings continued until comparatively recently; landscape that did not indicate the work of man was neither valued nor understood. The 18th century witnessed a change brought about by various factors; attempts to reproduce natural landscape became the goal of the Romanticist designers. These Romanticists soon went to extremes and absurdities in their designs, equal to those of the formalists whom they had superseded. The Industrial Revolution of the first half of the 19th century led to the general recognition in Europe and America of the value to the public of designed and organized cities, and of parks, reservations, and other outdoor areas, as well as a greatly increased interest in private pleasure-grounds of various kinds.

elements of his compositions. The landscape architect uses materials that are subject to change through the years, ground forms and vegetation being the principal ones in this group; he must know what the ultimate effect will be twenty-five or fifty years hence. Thus the problems are quite different from those of the architect who deals with rigid forms and static masses. In his formal designs of land areas, in close conjunction with buildings, the type of beauty which he seeks may not be widely different from that sought by the architect. But in naturalistic designs the landscape architect must be keenly sensitive to the character of the immediate region in order to be successful in his preservation and enhancement of natural scenery.

Development of Landscape Styles.—The basic factors influencing landscape design are similar to those affecting architecture in the development of the various historic styles. For example, the Chinese designs were influenced by the teachings of Confucius and Buddha that "man is not lord of the universe but merely one of the ten thousand things" and can attain satisfaction and

ultimate bliss only through close association with and quiet contemplation of nature in its various forms. The ancient Egyptians, on the other hand, developed their art of landscape design in a definitely restricted area and harsh climate, hot and dry, with frequent sand storms, and dependent on irrigation from the river Nile. Here religion, form of government, and the general living conditions all produced a highly organized and regulated life with its consequent development of a formalized, symmetrical type of design for outdoor areas. A somewhat similar situation occurred in ancient Persia. It remained for the Mohammedans there in the 8th and 9th centuries to create designs based on the Koran, that supplied the people with the types of landscape they craved and which they were told they would find in Paradise, luxuriant vegetation and shade, running water and flowers, and pleasant outdoor areas for mental and physical relaxation. Here climate and religion, as the dominant factors influencing the landscape design, succeeded in producing a style that survives to the present day in the warmer climates of Spain, North Africa, and the southwest United States.

The ancient Greeks, on the other hand, believed the natural landscape to be peopled with deities and minor spirits; mountains, woods, brooks, and caves were regarded with religious

An informal water garden, Japanese in character.

awe—often with fear. As a result their land areas developed for human use and enjoyment were confined largely to the courtyards of dwellings and to a few groves and meadows held sacred for religious observances and meetings. The Greeks may be said to have originated the "urban philosophy" of design, although the placing of their public buildings and temples was based on topography and the demand for physical security.

The Romans, after their conquest of Greece, adapted the Greek form of house, with its interior courts, to their own mode of living. The atrium and peristyle of the Roman house and country villa grew from these small interior courtyards to the great outdoor areas for special uses during the period of the Roman emperors. The enormous scheme of the Emperor Hadrian at Tivoli (125 A.D.) contains the same types of outdoor recreation areas as are to be found in the Laurentine and Tusculan villas (70 A.D.) of Pliny the Younger. Here again we find the influence of climate, topography, and of physical environment to be factors in design. The new cities built by the Romans in their colonial empire gave opportunities for land planning that met the needs of the time to a remarkable degree, though little is left today but scattered ruins and fragments.

After the collapse of the Roman Empire the chief problem was one of personal security; landscape design was influenced primarily by economic, political, and topographic conditions as evidenced by the feudal castle and the walled town. Outdoor pleasure areas appeared only with the slow restoration of political and social stability, though the knowledge of horticulture was kept alive throughout Europe during these "Dark Ages" by the religious establishments of the Christian Church, the Abbey of St. Gall (820 A.D.) in Switzerland being an example. But the inherent desire in man for attractive surroundings gradually produced a change in the land imme-

A city back yard.

diately adjacent to the castle; various enclosed areas were developed such as the "flowery mead," "pleasaunce," and other special garden plots, and the herb, fruit, and physic gardens. Contact with the Mohammedan civilization during the Crusades brought new life to the European designs through the greater use of colors, the pavilion or tent fountains, and new and decorative plant materials; all this resulted in more attractive appearance and greater intricacy of design in detail and pattern, culminating in the *carreaux* of French pre-Renaissance designs and the "knott" gardens of the Elizabethan era in England. But these outdoor areas were designed to be separate, en-

closed spaces, bearing little or no visual relation to one another or to the house façade.

Then came the Italian Renaissance with its ardent enthusiasm for classic form and detail. The ambition of the landowners was to imitate the villas of imperial Rome, based however on their own interpretations of the descriptions left by the classic writers. The desire and efforts of the papacy to make Rome the artistic as well as the political and religious center of Europe provided the stimulus to greater work. In the early period of development, these Italian Renaissance designs were usually the unified work of one man, often a well-known architect or sculptor, and the designs and details of the various outdoor areas reflect the rise and growth of the style of the Renaissance in the other arts. The site chosen was usually on ground sloping toward the southwest or prevailing winds, with water supply available for cascades, pools and fountains to add to the interest of the outdoor areas related to the house or casino. The typical plan was rectangular, a walled area on rising ground divided into three main design units. These were the parterre or flower garden, the system of terraces with cascades, fountains and pools, and the *bosco* (grove) at the upper end; the house might be

sailles as a hunting lodge (1624), and Rueil (1627).

Under Louis XIV (r. 1643-1715) was developed the "grand style" through the ability and enthusiasm of André Le Nôtre (1613-1700) and the unlimited funds supplied by the king. Le Nôtre recognized that the Italian designers had shown in their villas a feeling for the beauty of water, displayed in increasingly ingenious ways; for the relief of shade and its contrast in design with sunlit areas; for the inspiration of the open, distant view; and a feeling, never as yet elsewhere equalled, for effective formal design in materials of architecture and vegetation. Le Nôtre succeeded in producing similar effects but on a huge scale. The climate, topography, and water supply were not the same as in Italy and the king required outdoor areas adequate for as many as seven thousand persons attending the court at Versailles, in contrast to the one or two hundred likely to be entertained at an Italian villa. It was also the period of colonial expansion, and new plants were sought and introduced from America and Asia. Although they could not duplicate the scale, the French nobility copied the pattern of Versailles in reorganizing their own estates, and elaborate formal plans were carried

Terrace garden for a modern house.

placed in relation to any one of these three. During the three centuries of development, the Italian designers constantly sought new forms and more grandiose effects until they finally arrived at a type of layout characterized by curvilinear lines and paths, extraordinarily restless and varied statuary, along with ingenious devices and tricks in the use of water until this desire to produce novel and startling effects could go no further and the decadent period of the Baroque gave way to the Romantic and naturalistic styles through the influence of England and France.

The invasions of the Italian peninsula by the French kings in the latter part of the 15th and early 16th centuries led to definite changes in French landscape design through the importation of Italian artists; they soon found that Italian villa layouts could not be reproduced in France because of the differences in climate, topography, and social and economic conditions. What little they were able to accomplish was stopped by the religious wars lasting nearly fifty years. Then came a revival of interest under Henry IV, continued by Richelieu and Louis XIII with such places as St-Germain-en-Laye (1610), the Luxembourg in Paris (1615), the beginnings at Ver-

out in rapid succession throughout the country. The rest of Europe was so greatly impressed with the result that the principles of design as developed by Le Nôtre dominated all countries for the next hundred years. Austria, England, the German principalities, the Netherlands, Russia, and the Scandinavian countries all attempted to copy the French style. But because of differences in the basic requirements they were unsuccessful in solving local needs and always remained "foreign design" introductions in the eyes of the people. Climate, topography, social conditions were not the same as in France, nor were finances as ample.

This copying of the French style by other peoples of Europe is an outstanding illustration of the fallacy of reproducing in any one region a scheme that has been developed in another under different basic requirements. The general dissatisfaction in England with this "foreign style," introduced by Charles II in 1685, evidenced almost at once by published criticisms and satires, led in about thirty years to the attempt to return to "natural forms" as opposed to the symmetrical, obviously man-made designs. The idea that "Nature abhorred a straight line"

was fostered and accepted as the new doctrine; this was stimulated also by the growing enthusiasm for the Far Eastern trade, especially with China. It soon became apparent that the members of this new school of thought understood the Chinese philosophy of design even less than they did the French principles. In the wake of this English enthusiasm other European countries perpetrated much that gave real credit to no one, and the Anglo-Chinese fashion was short-lived in landscape design though it is still apparent in furniture. The Romantic style, of which the Anglo-Chinese was a phase, substituted the formless for the formal and the Romantic as the symbol for aesthetic unity before it settled down to the more rational landscape style of Humphry Repton (1752-1818) in England and of Hermann von Pückler-Muskau (1785-1871) in Germany.

By 1800 the pendulum of taste was swinging back to classical forms and a modified type of symmetry in landscape designs as well as in architecture, as shown in the Napoleonic era on the Continent. The first third of the 19th century produced in Europe as well as in America rapid changes in living conditions. New problems arose for the treatment of the landscape; one of these was to provide outdoor space for others than the wealthy landowners. The social reforms inspired by the American and French revolutions, com-

ation, probably one of the earliest examples of what today we know as a public park.

The work of Repton in England inspired the park-like estates in America with which Andrew Jackson Downing was familiar, and the tradition of which he followed in his own designs but with increasing emphasis on the use of native vegetation. At the time of his death (1852), the industrial growth of the United States had begun to cause congestion in the towns and cities, and Downing was a leader in the movement to ameliorate the life of the crowded areas by the provision of public parks. William Cullen Bryant and many others not landscape architects also took an active part in this campaign for social betterment. The style of naturalistic landscape design developed to meet this need was the work of Calvert Vaux (1824-1895) and Frederick Law Olmsted (1822-1903); it is characterized by compositions of open meadows enclosed and diversified by woods, in which the public may find a sense of seclusion as well as of relief from the insistence of urban surroundings. The first project was Central Park, New York City (1858), followed by Prospect Park in Brooklyn (1876) and Frank-

Corner in a small garden.

bined with the industrial development that followed within a few decades, made necessary the provision of open spaces where the people moving into densely populated centers could have rest and relaxation under naturalistic, "country" surroundings. Among the early examples of this new type of design are Birkenhead Park (1845) near Liverpool by Sir Joseph Paxton, and the Bois de Boulogne in Paris (1853) by Jean Charles Adolphe Alphand.

Contemporary with the Renaissance in France, the Mogul dynasty in India was creating designs of Persian-Mohammedan character on a very large scale. These projects met the requirements of climate and court life with shaded areas and open sunlit spaces, pools with jets of fine spray to cool the air, flowers in masses for color and perfume. These Mogul gardens rival in size and magnificence the work of Le Nôtre in France and include such places as the Shalimar gardens in Kashmir (1619) and in Lahore (1634). The outdoor areas within the enclosures of the "forts" or citadels were of similar character, though more obviously planned on the Koran's description of Paradise with its "four-way river" and the "island of the blessed" at the intersection. The Taj Mahal (1632-1645) was endowed by Shah Jahan for the purpose of maintaining it in perpetuity for all peoples as a place of rest and relax-

Garden seat as a terminal feature.

lin Park in Boston (1886). In these three parks the style is found at its best, a style which has had a profound influence ever since on the work of the landscape architect both in the United States and elsewhere. Other practitioners extended the park movement in the Western states, particularly Horace William Shaler Cleveland (1814-1900) who also pointed out through his writings the necessity for the application of the principles of landscape architecture to the planning of new towns. Charles Eliot (1859-1897), later a partner of Olmsted, is especially known for his activities culminating in the park system of Boston with its outlying reservations and circumferential parkways (1893). The work and writings of both Olmsted and Eliot influenced park development extensively, as in such cities as Cleveland, Chicago, San Francisco and St. Louis.

Large private estates as well as smaller properties in the United States followed the general character of park design up to the early years of the 20th century. In Europe this was also true where new projects and many of the older places were altered to give a park-like atmosphere and open views combined with formal gardens near

the house. The period from 1910–1930 witnessed in the United States the extensive copying and adaptation of foreign styles of architecture in the design of private residences, with a corresponding treatment by the landscape architects of the outdoor areas; these types included Georgian, French, Italian, Spanish, and Tudor, and with few exceptions met the requirements of the client with apparent satisfaction. But the economic depression of the 1930's and the subsequent economic changes raised maintenance and construction costs to a point that prohibited further development and also brought about the loss and destruction of many of these designs. The two world wars brought new problems for the landscape architect. These were generally of a public nature, including the site-planning of army installations and camps, large recreation areas, government housing projects and industrial developments. This volume of work produced a demand for trained and competent landscape architects greater than the supply, with the result that none were out of work in their own field even in the depression years. The importance of the profession is recognized by the federal government and other public agencies; in the field of public housing the law now requires that a landscape architect be one of the team of three—architect, landscape architect, and engineer—responsible for the plans. The collaboration of these three professions proved its value by the results achieved.

In Europe between 1830 and 1930 landscape architecture was not recognized as a separate profession to the same degree as in the United States. Since then, however, the developments in England and Scandinavia have been similar to those in America, especially in town planning and other work of a public nature. One reason for this apparent lack of recognition of the importance of the landscape architect may be due to the fact that the European countries have far less new and undeveloped land to deal with, since their properties are developed and in intensive use. But the value to the public of the preservation of natural landscape is becoming realized, especially in England, as evidenced by the formation of the National Trust (founded 1895), a society "for the preservation of places of historic interest or natural beauty," and in other activities.

The two world wars with their accompanying disruption of former economic and social orders also brought dissatisfaction with the existing styles in the arts. Definite attempts were made in France and Germany to develop new forms, new modes of expression and new vocabularies for architecture, painting and sculpture. The new structural materials provided the stimulus in architecture, for example, and the results, sometimes referred to as "modern" or contemporary design, had their effect also upon landscape design. The vociferous proponents of the new style were active in their condemnation of all historic pattern and detail, of all that was formal or symmetrical in appearance; they sought new and different compositions. While this quest for new forms might be achieved in the static materials of architecture it was less easy to produce successful solutions in the materials used by the landscape architect—vegetation and ground forms—except in the small confines of a house yard or immediate surroundings. Here the results appear as ingenious ground patterns, plant forms of unusual or exotic character, and frequent use of the new structural materials, such as glass and plastics, as decorative

features. Many of these are interesting and some are successful as landscape designs within a limited field, yet many are so obviously the attempts for something different that the aesthetic satisfaction in the result is lacking.

From the viewpoint of the historian, this situation is analogous to that of the middle of the 18th century in England when the pendulum of taste swung to an extreme in opposition to the old traditions. There is reason to feel that in due time it will become more stabilized and result in the development of a new and national style of design.

Training for the Profession.—The apprentice system in private offices was the only means of acquiring the experience and training needed to become a landscape architect until the early years of the 20th century. In 1901 the first professional, technical course was established at Harvard University and almost immediately placed on a graduate basis; this action was followed rapidly by other colleges in various parts of the country. In 1928 the American Society of Landscape Architects (incorporated 1899) published a statement outlining what it considered to be the essential subjects required for the training of a landscape architect and the minimum amount of time that should be given to these various courses in an acceptable professional curriculum. This *Outline of Minimum Educational Requirements* has served to strengthen the field of education. Instruction is offered in 23 colleges and schools in the United States, 11 of which meet the standards set up by the professional society. All these courses, with the exception of the graduate course given at Harvard University, are given on the undergraduate level, although schools provide options for a continuance in advanced study and research. Compared with other professions, such as architecture and engineering, the field of landscape architecture is not a "crowded" one, the total enrollment in the various colleges in 1950 for this work amounting to 727 students. The total membership of the professional society is approximately 800.

In Europe the training remains under the apprentice system to a considerable extent, due to the lack of technical instruction in the colleges and universities. But in England several courses are being established through the efforts of the British Institute of Landscape Architects, as those at Durham, Liverpool, and London. With the exception of those who enter the field of landscape architecture through city planning, the approach tends to be through that of horticulture, or architecture, rather than engineering. This progress in the training and employment of the landscape architect is more apparent in England and Sweden than in other countries of Europe where the problems are handled to a large extent by those trained in horticulture or with an architectural background. The British Institute of Landscape Architects established in 1930 under the active leadership of Brenda Colvin, Geoffrey Alan Jellicoe, Thomas H. Mawson, Richard Sudell and others is largely responsible for this development in the profession. For example, in 1949 a National Parks and Access to the Countryside Bill was proposed to protect areas of outstanding natural beauty.

The establishment of an International Conference of Landscape Architects in 1946 and the holding of annual meetings in different countries is proving to be an effective stimulus to the pro-

fession both in its work and in the interchange of professional ideas; the meeting in Spain in 1950 was attended by 172 delegates representing 22 different countries.

Practice of Landscape Architecture.—Each typical, well-defined use of the land has its characteristic effect on the composition, no matter what the other circumstances may be. Because of this the work of the landscape architect falls into classes according to land usage. This practice includes many problems ranging from the planning of home grounds to the larger ones of parks, parkways, playgrounds, the various types and sizes of land subdivisions, school and college grounds, cemeteries, housing, industrial development, airports, controlled access highways, city and regional planning; many of these may be undertaken by either public or private agencies and the work done by persons practicing on a professional basis, through their own offices, or as employees of public, state, or federal organizations. In some cases the landscape architect may serve as the consultant to the individual client, group or agency. The professional practitioner, whether or not he is a member of the American Society of Landscape Architects, receives his remuneration directly from the client and has no financial interest whatsoever in the labor, materials, or persons supplying the same for the project; his fee may be a lump sum for a stated piece of work, a percentage charge on the total costs, or a charge per day, or on a time basis. Those preferring to work on a commercial basis—and many of these do excellent work as designers—receive some part of their remuneration through a profit derived from labor or materials or both. Similar methods are followed in all countries by both groups. In his practice the professional landscape architect tries to meet the demands of each problem with a design which combines the maximum of aesthetic and economic excellence possible under the given conditions of topography, soil, climate, and financial means available. No two problems are ever exactly alike; it is seldom that design details can be successfully standardized, as in architecture or in engineering. Collaboration between the landscape architect and the architect occurs on problems of the private estate, and where architectural structures play an important part in the outdoor compositions. During World War I collaboration developed further to include the civil engineer on the design of communities, army cantonments, government war housing, industrial plants and similar problems. This collaboration has continued to expand ever since, until most federal agencies now require a landscape architect for the site-planning and other phases of the development of the land, acting as one member of the design team along with the architect and engineer. Another field of collaboration is that of city planning, and here the landscape architect works with the engineer, architect, sociologist, economist, and lawyer; but the delimitation of this field cannot be territorial, as in the case of a building and its grounds, but must be according to the subjects in which the various collaborators are severally skilled. As in other instances, the best results are obtained when each collaborator appreciates the point of view of the others and has a sound fundamental conception of the entire problem before him.

The types of work done by landscape architects in other countries vary with the existing

social and economic conditions. In Canada, for example, the field of activity is similar to that of the United States. The president of the British Institute of Landscape Architects, Geoffrey A. Jellicoe, stated in 1943 that, in England, the landscape architect is complementary to the architect and civil engineer and town planner; that he is concerned with scenery, parks, and gardens; with afforestation, agriculture, and all open spaces; with the disposition of houses, industries, and other buildings thereon; and with the relevant means of transport. Problems of estate design, following World War II, are less numerous than in the United States, but a great deal of work is being done on public projects and in town planning through collaboration with the other professions. The situation on the Continent is very similar, with the emphasis on works of reconstruction and rehabilitation to the point where few private projects are undertaken. The development of large areas of natural landscape for preservation and the enjoyment by the public is just beginning in England, while in the other countries there are no notable results. In Denmark, Norway, and Sweden the activity of the landscape architects appears greater than elsewhere, especially in Sweden where their work in the problems of housing, recreation, and park design has aroused much attention in the United States, as well as favorable comment in view of the design factors of rigorous climate, topography, and social requirements. The solutions, simple, straightforward and functional, appear to call for the minimum of maintenance—an economic factor of importance.

From earliest times till the eighteenth century landscape architecture was appreciated and enjoyed by relatively few persons. Nevertheless it always exerted an influence on the culture of each people by its stimulus to outdoor recreation and to the appreciation of pleasant surroundings. The social and economic changes during the past two hundred years have completely changed this enjoyment by few to appreciation by many. Undoubtedly the profession will become more active in the future in all forms of land development for human use where good appearance of the result is considered.

LANDSCAPE GARDENING. See **LANDSCAPE ARCHITECTURE**; **HORTICULTURE**.

LANDSCAPE PAINTING, the painting of natural outdoor scenery as distinguished from portrayals of the human figure, still life, or interior scenes. Until the late Middle Ages it never occurred to anyone that nature was beautiful in itself, and the idle contemplation of natural scenery as a source of pleasure would have been considered reprehensible. By the 12th century, however, formal gardens had come into being and certain aspects of nature began to be represented by artists. The first true landscape painting may be said to have started in the 14th century, when the frescoes in the pope's palace at Avignon were painted (1343). The idea may have been taken over into painting from decorative tapestries.

Gothic Landscape.—Landscapes of a rudimentary sort were employed as backgrounds in religious paintings from the time of Giotto (1276?-1337) onward. They came into much more general use in the 15th century. These landscapes were usually wild and rough with forbidding, fantastic-looking mountains—scenes that the artist felt were suitable to the mood of his picture rather than any particular view he had actually observed. In contrast were the more intimate garden scenes sometimes connected with the Garden of Eden, sometimes with symbolic stories of ladies and unicorns. The passion of the aristocracy for hunting also stimulated artists to represent outdoor scenes.

The so-called International style practiced in the early 15th century by such Italian artists as Gentile da Fabriano (1360/70-1427), Il Pisanello (Antonio or Vittore Pisano, c.1395-c.1455), and Benozzo Gozzoli (1420-1497) provided the most elegant of all early landscape settings. Gozzoli's *Journey of the Magi* (1459) in the Riccardi Palace in Florence is the most elaborate of these fanciful late Gothic landscapes. At the same time, it marks the end of an era, for new forces were at work and a new vision had already come into being. The Renaissance had dawned in Florence and meticulous realism held sway in Flanders to the north.

Northern Renaissance.—The Flemish brothers Jan (1370?-1440) and Hubert van Eyck (1366?-1426) introduced enchanting magical backgrounds which may be considered the first modern

landscapes to appear in northern Europe. They were so carefully observed that they must have been based on sketches actually made from nature.

In Germany during the last decade of the 15th century Albrecht Dürer (1471-1528) did a series of water colors direct from nature which are as fresh and as exactly "seen" as the work of contemporary artists. Albrecht Altdorfer (c.1480-1538) portrayed the German forest in exquisite detail, and Matthias Grünewald (1470?-1531) painted eerie landscape backgrounds to add intensity to his dramatic religious themes. The Flemings were the first, however, to render a true sense of distance, a conception of real space, through the manipulation of light and atmosphere.

Pieter Brueghel the Younger (1564?-1638) stands out as a great master of landscape in which fact and fantasy are mingled. The great Dutch landscapists of the 17th century were more matter of fact. Jacob van Ruysdael (c.1628-1682) was the most important specialist in this field with Albert Cuyp (1620-1691), Meindert Hobbema (1638-1709), Adriaen van de Velde (1636-1672), and Jan van de Cappelle (1624-1679) as secondary figures. Rembrandt van Rijn (1606-1669), on those few occasions when he turned to landscape, produced the most moving, profound, and intense paintings of all. The genius with which he depicted the inner aspects of human beings was equally discernible when applied to landscape.

Italian Renaissance.—In Italy Piero della Francesca (1420?-1492) made great strides in landscape, and Giovanni Bellini (c.1431-1516) in Venice made an equally great contribution. Leonardo da Vinci (1452-1519) applied his great scientific mind to landscape backgrounds in such great pictures as the *Virgin of the Rocks* and the *Mona Lisa*. From his time on the landscape setting became ever more important in Italian paintings; and Catholic Italy, where the churches continued to be adorned with paintings, enjoyed just as great a flowering of landscape art as Protestant Holland, where church painting was not permitted. The leading Venetian masters contributed much to this development—the lyrical Giorgione (c.1478-1510), the more intense Titian (1477-1576), the dynamic Tintoretto (1518-1594), and the exuberant Paolo Veronese (1528-1588) whose decorations at the Villa Maser (1560) are memorable. The Venetian tradition also produced El Greco (c.1541-1614), whose *View of Toledo*, intense, forbidding, and at the same time ecstatic, is one of the greatest landscapes of all time.

The 17th century saw the birth of "pure" landscape in Italy, as it did in Holland. Most prominent was the group in Rome including the French-born Claude Lorrain (1600-1682). He made sketches direct from nature and evolved them into ideal, romantic conceptions which transcend reality. With him was another Franco-Italian, Nicolas Poussin (1594-1665), whose work was far less poetic and more classically well ordered, with everything in its place and nothing left to chance. Salvator Rosa (1615-1673) depicted the wilder, more forbidding aspects of nature, which in the 18th and early 19th centuries were termed "sublime." In 18th century France Jean Antoine Watteau (1684-1721), Jean Baptiste Joseph Pater (1695-1736) and Jean Honoré Fragonard (1732-1806) did delightful rococo landscapes peopled with actors of the Italian *Commedia dell'Arte* or with elegantly dressed members of the court, gay compositions which were called *fêtes gallantes*.

LANDSCAPE PAINTING: (Top) Charles Sheeler's "American Landscape, 1930," and (bottom) Paul Cézanne's "Landscape with Viaduct"; Sheeler's painting, photographic and dealing with the machinations of man, Cézanne's, impressionistic, treating nature simply in design.

The 19th Century.—English collectors in the 18th century were enthusiastic about Italian landscapes, as were such English painters as Richard Wilson (1714–1782). Thomas Gainsborough (1727–1788), though famed for his portraits, was a landscapist of the first order. England's greatest contribution to landscape, however, came in the early 19th century with J. M. W. Turner (1775–1851) and John Constable (1776–1837). Turner's late works, with their dramatic color and dynamic movement, seem to be forerunners of expressionism, just as Constable's luminous scenes of the English countryside lead to impressionism. Constable's *Hay Wain* is a classic of English painting.

In France Jean François Millet (1814–1875), Charles Daubigny (1817–1878), Jules Dupré (1811–1889), and others settled in the village of Barbizon to depict the simple life of the French peasants. They still painted with a dark palette in the studio, but at least they had broken with the old tradition and avoided mythological or historical subjects in favor of the life around them. Jean Baptiste Camille Corot (1796–1875), first attracted to the classical style of Poussin, later developed a feathery poetical style which was ultimately vulgarized by too frequent repetition. Gustave Courbet (1819–1877) brought realism into its own with his vital brush and powerful rendering of the living essence of nature. With the impressionists Claude Monet (1840–1926), Camille Pissarro (1830–1903), and Alfred Sisley (c.1839–1899) came light and sparkling sunshine, clear colors, and the instantaneous vision of a landscape depicted on the spot and at an exact moment of the day. Their experiments with light have had a lasting effect, but their weakness lay in the fact that form was sacrificed to surface effects of light.

Another phase of 19th century landscape was the romantic trend which developed especially in Germany and the United States, with apparently no connection between the two other than a common interest in romantic literature and philosophy. Caspar David Friedrich (1774–1840) at the beginning of the century did craggy northern islands and forests, with people looking nostalgically inward toward the view. In America a similar point of view was expressed by the Hudson River school of landscape painters such as Thomas Cole (1801–1848), Thomas Doughty (1793–1856), John F. Kensett (1818–1872), and later Albert Bierstadt (1830–1902). After these came George Inness (1825–1894), who made a new contact with the main stream in Europe by following the trends of the Barbizon school. Winslow Homer (1836–1910), the great American realist, followed a more indigenous trend with his rugged, forthright scenes of the coast of Maine and the Adirondack woods.

Postimpressionists and Moderns.—The last two decades of the 19th century witnessed more innovations. The postimpressionists brought form back into painting and used color, not scientifically, but emotionally. Paul Gauguin (1848–1903) sought the exotic atmosphere of the South Seas. Vincent van Gogh (1853–1890), painting in the brilliant sunlight of southern France, expressed his inner turmoils in some of the most vibrant and exciting landscapes ever painted. Paul Cézanne (1839–1906), in a more self-contained manner, patiently and slowly built up form from color, painting landscapes that have a solid, firm, eternal quality. Mont-Sainte-Victoire became as much a symbol to him as the rocky heights of Toledo had been for El Greco.

In the 20th century Henri Matisse (1869–1954) continued this heritage of color by painting vivid palpitating landscapes. Followers of Cézanne like Pablo Picasso (1881–) and Georges Braque (1881–) developed cubism, a formal analysis of the basic elements of pure form. Their theories, however, were seldom applied to landscape. By and large the *avant garde*, those who have widened the areas of painting, have confined themselves to people and objects as their point of departure, or have dealt with pure abstract designs. An exception is the American John Marin (1870–1953) who painted the rugged Maine coast in transparent water color, in a style based on cubism. Otherwise 20th century landscape has been the province of neoromanticists like Eugène Berman (1899–), who treats it with a nostalgic backward glance expressed in tasteful color and dashing drawing; and of surrealists like Yves Tanguy (1900–1955) and Salvador Dali (1904–), who fuse the fantasies and irrationalities of the dream world with reality. See also DUTCH PAINTING; PAINTING; sections on art in articles on FRANCE, GERMANY, GREAT BRITAIN, ITALY, NETHERLANDS, and biographies of individual artists.

FREDERICK A. SWEET,
Curator of American Painting and Sculpture, The Art Institute of Chicago.

LANDSEER, SIR EDWIN HENRY, English animal painter: b. London, England, March 7, 1802; d. Oct. 1, 1873. Hampstead Heath was the scene of some of his early studies, and on one of his early productions now at Kensington his father has written "at the age of five." Following the advice of Benjamin Robert Haydon he studied the Elgin Marbles and the wild beasts at Exeter Change and dissected every animal whose carcass was obtainable.

His life is the record of his works and successes. In the academy's exhibition for 1815 he exhibited the *Portrait of a Mule* and the *Heads of a Pointer-Bitch and Puppy*. In 1818 he contributed several studies of animals to the academy and the British Institution. In that year a picture exhibited at the exhibition of the Oil and Water Color Society in Spring Gardens, *Fighting Dogs Getting Wind*, attracted great attention and set a seal upon his work. In 1820 he painted his *Dogs of St. Gothard*. In 1821 he exhibited *Ratcatchers*, a *Prowling Lion* and other works of great spirit. In 1822 he received the premium of £150 from the British Institution for the *Larder Invaded*. The *Cat's Paw* appeared at the academy in 1824 and was sold for £100. In 1826 he was elected A.R.A., and in 1831 became R.A. In 1827 he exhibited *The Return from Deer-Stalking; a Fire-side Party*, 1829; *High Life and Low Life*, 1831; *Spaniels of King Charles' Breed*, *A Jack in Office*, 1833; *Bolton Abbey in the Olden Time*, 1834; *The Drover's Departure*, 1837; *The Return from Hawking* and the *Shepherd's Chief Mourner*, 1837; *A Distinguished Member of the Humane Society* and *There's Life in the Old Dog Yet*, 1838; in 1840, *Laying Down the Law*; in 1844, *Coming Events Cast Their Shadows Before*, and in 1846, *The Stag at Bay*; in 1849, *The Forester's Family*; in 1850, *A Dialogue at Waterloo*; in 1851, *A Scene from the Midsummer Night's Dream*; in 1853, *Night and Morning* and *The Children of the Mist*. His later works include *Saved*, *Deer-Stalking*, *A Flood in the Highlands*, *A Random Shot* (the most

pathetic of all his works), 'Wild Cattle at Chillingham,' and his celebrated work of sculpture, the Lions in Trafalgar Square. Landseer's pencil was productive, and besides many works not here named he produced portraits of celebrities of the time, that of Sir Walter Scott being in the National Gallery. In 1850 he was knighted; in 1855 he received the gold medal of the Paris exhibition. He declined the presidency of the Royal Academy offered him on the death of Sir Charles Eastlake (1865).

Landseer, notwithstanding his notable work in portraiture, was essentially an animal painter, his success being in fur rather than in flesh. Down to about 1823 he was content to reproduce the natural expression and characteristics of animals, but after that date, at the sacrifice of genuine artistic qualities, his animal pieces are treated with more or less pictorial effects, with the idea of enforcing the analogy between the character of men and dogs. Dogs and deer are his favorite subjects. His draughtsmanship is facile and elegant, and he was exceedingly rapid in execution. He held a distinguished place in the society of his time, but his abnormal sensibility made him in his later years acutely liable to fits of mental depression due to imagined slights by social superiors. Consult Graves, A., 'Catalogue of the Works of Sir Edwin Landseer' (London); Mawson, J. A., 'Landseer' in 'Makers of British Art' (London 1902); Monkhouse, Cosmo, 'Studies of Sir Edwin Landseer' (London); Stephens, F. G., 'Sir Edwin Landseer' (ib. 1880); Sweetser, M. F., 'Landseer,' in 'Artist Biographies' (Vol. III, Boston 1878).

LANDSHUT, länts'hoot, Germany, capital city of lower Bavaria, on the right bank of the river Isar, and 40 miles by rail northeast of Munich. From 1255-1503 the town was capital of the duchy Bayern-Landshut, and in 1800-26 it was the seat of a university. There is a fine Italian Renaissance palace built in the 16th century, and near the town is the ancient castle of Trausnitz, once a seat of the dukes of lower Bavaria. There are 11 churches, one of which, a Gothic brick edifice, dates from 1392 and has a tower 435 feet high. The Cistercian nunnery of Seligenthal, founded in 1232, is near the city, and has a church built in 1729-38. The city is important for its manufactures and markets. Pop. 30,197.

LANDSKRONA, läns-kroo'na, Sweden, a fortified seaport town on the east side of the Sound, 15 miles northeast of Copenhagen. It has a castle which was completed in 1543 and is now used as a prison, and opposite the town on the island of Hven is the famous subterranean observatory of Uranienborg, built by Tycho Brahe in the 16th century. The modern town ranks 12th in the manufacturing industry of Sweden, leather and sugar products being of chief importance. There are coal mines in the neighborhood and the town possesses an excellent harbor 35 feet in depth. The harbor was the scene 24 July 1677 of a great naval battle in which the Swedes were victorious over the Danes. Pop. 18,437.

LANDSLIDE, or **LANDSLIP**, the slipping or sliding of land, through the failure of supporting strata, from its original position. They are due to a variety of causes. Water, particularly in its changing forms through frost

and thaw, is the chief agent in their production. The wearing away of supports by water, the cracking of underlying materials by summer droughts and the rending of existing crevices by the thawing of water frozen in them are some of the commonest modes by which they are brought about. Sometimes a mass of land resting on an inclined bed slides for a considerable distance before it is arrested by a level surface; thus, in 1772, the Solway Moss, loosened by excessive rains, rolled over 400 acres of cultivated land, reaching in some parts to the roofs of the houses. The fall of the Rossberg in Switzerland and the slip at Charnmouth, near Lyme Regis, are other familiar instances. In 1902 in British Columbia a remarkable landslide occurred destroying an entire mountain village and causing the death of nearly 100 persons.

'Landslide' is a term employed in United States political phraseology to denote the crushing defeat of a political party in an election, and especially of the overwhelming defeat of the party in power, as for example, the Democratic landslide of 1890 and the Republican landslides of 1896, 1920 and 1924.

LANDSMAN, in the United States navy an enlisted man who is not in the seaman branch of the service, but takes the rating of third class seaman. Persons possessing a mechanical trade may be enlisted up to the age of 30 years instead of 25 years as in other branches of the service, and a landsman enlisted for a special position must have the fact recorded on his service card. Originally the term embraced the lowest rating in all branches of the enlisted force of the naval service, but latterly the term has been confined to men enlisted in the artificer or special branches, while in the seaman branch the lowest rating is that of apprentice seaman.

LANDSTAD, länd'stad, **Magnus Brostrup**, Norwegian bishop, folklorist and poet: b. near North Cape on the island of Maasö, 7 Oct. 1802; d. Christiania, 8 Oct. 1880. He was educated for the ministry and became minister at Seljord, where he lived until his retirement in 1876, after which time he resided in Christiania. His literary activities were confined chiefly to versification of folklore and to the composition of hymns. His 'Norske folkeviser' (1851-53) comprised about 130 poetic versions of folklore, set to music by Lindeman. He, together with Andreas Faye, was a pioneer in the classification of Norse folklore. Landstad made a translation of the hymns of Luther (1855) and he also compiled a book of hymns, 'Kirkesalmebög,' which in 1869 was adopted for use in the Norwegian churches and which contained some 60 hymns of his own composition. He also published 'Digte og sange' (1879), and 'Gamle sagn om Hjartdölerne' (1880).

LANDSTURM (land storm, land uprising), in certain European countries a defense force comprised, in practically all cases, only of men who have undergone at least some military training. In Switzerland, for example, the Landstrum is composed of men who have served 12 years in the first line and 8 years in the Landwehr (q.v.). In Sweden the *Landstorm* is composed of men who have served 15 years in the active army.

LANDWEHR, länt' vär («national defense»), in certain European countries a de-

fense force comprised of men who, having completed certain prescribed periods of military training, are permitted to return to civil life and, except for brief periods of training, are recalled for military service only in cases of emergency. In Switzerland, the service is 12 years in the first line, and then eight years in the Landwehr before passing into the Landstrum for eight more years.

LANE, Alfred Church, American geologist: b. Boston, Jan. 29, 1863; d. there, April 15, 1948. He was graduated from Harvard University in 1883 and studied at the University of Heidelberg, 1885-1887. He was instructor in mathematics at Harvard in 1883-1885; petrographer of the Michigan Geological Survey and instructor in the Michigan College of Mines in 1889-1892; assistant, then state, geologist of Michigan in 1892-1909. From 1909 to 1936 he was Pearson professor of geology and mineralogy at Tufts College and from 1924 he was a member of the commission to oversee the Harvard Observatory. He was a delegate to the international Geologic Congress in 1913, 1933 and 1937. Besides many articles, he was editor and part author of various reports on geologic surveys in Canada as well as those of the United States Geologic Survey.

LANE, Edward William, English Orientalist: b. Hereford, Sept. 17, 1801; d. Worthing, Sussex, Aug. 10, 1876. Owing to a breakdown in health he went to Egypt in 1825, lived the life of its people and adopted the dress of the country. In 1836 he published *Manners and Customs of the Modern Egyptians*, a book which bears on every page the stamp of authenticity. His next work was the first accurate version and one of the most famous translations of the *Arabian Nights* (1838-1840). This work was the first translation of consequence into English, which was made directly from the Arabic, all previous translations having been made through the French. It contained valuable illustrations and numerous scholarly and indispensable notes. The translations of Burton and Payne were subsequent to it. The world is indebted to him for many valuable works on Egypt and especially for his *Arabic-English Lexicon* (1863-1874), which cost him 30 years of unremitting labor, the expense of production being generously undertaken by his friend, the 4th duke of Northumberland. The succeeding parts came out from 1877 to 1892 under the editorship of S. Lane-Poole, the whole forming a dictionary indispensable to the students of Arabic. See also *ARABIAN NIGHTS*. Consult his *Life* by S. Lane-Poole (London 1877).

LANE, Franklin Knight, American Cabinet officer: b. Prince Edward Island, Canada, July 15, 1864; d. Rochester, Minn., May 18, 1921. He removed to California in early childhood and was graduated at the University of California in 1886. He engaged in newspaper work and in 1889 was admitted to the bar of California. He practised law in San Francisco, where in 1897-1902 he was city counsel. He was active politically and in 1905-1913 served on the Interstate Commerce Commission, receiving his appointment from President Roosevelt. In 1913 he was appointed secretary of the interior in the Cabinet of President Wilson.

LANE, George Martin, American educator: b. Charlestown, Mass., Dec. 24, 1823; d. Cambridge, Mass., June 30, 1897. He was graduated from Harvard in 1846 and after four years at the universities of Berlin and Göttingen returned to America and became professor of Latin at Harvard in 1851. He held his chair until 1894 when he became professor emeritus. He published *Latin Pronunciation* (1871) in which he contended for the continental pronunciation of the language as against the "English method." His scholarly fame rests on his posthumously published *Latin Grammar for Schools and Colleges* (1898), completed by Morris Morgan. Dr. Lane had worked on this text, described by Professor Gildersleeve as "a monument of literary art and sympathetic interpretation," for nearly 39 years. He also wrote the burlesque *Lay of the Lone Fish-ball*, long popular in Harvard undergraduate circles.

LANE, Harry, American legislator: b. Corvallis, Ore., 1855; d. San Francisco, Calif., May 23, 1917. He was graduated at the Willamette University in 1876 and engaged in the practice of medicine at Portland, Ore. He was superintendent of the Oregon State Insane Asylum in 1887-1891, and was mayor of Portland in 1905-1909. He was elected to the full term in the United States Senate in 1913. He was an advocate of government ownership of telegraphs and telephones. In the debates on the Armed Neutrality Bill, Senator Lane greatly incensed his constituents by taking part in the filibuster of March 5, 1917 against the bill.

LANE, Henry Smith, American politician: b. in Montgomery County, Ky., Feb. 24, 1811; d. June 18, 1881. He studied law, and was admitted to the bar; removed to Indiana in 1832, and while engaged in his profession became prominent in Whig politics. After serving as state senator (1837), he was twice elected to Congress (1838 and 1840), and in the Mexican War was lieutenant colonel of an Indiana regiment. The dissolution of the Whig Party was followed by a preliminary organization which led to the formation of the Republican Party, and in this movement Lane was conspicuous, acting with other leaders who planned the first Republican national convention, held in Philadelphia in 1856, and of which he was permanent chairman. A coalition of Republicans with members of the disappearing American party in 1859 elected him to the United States Senate, but after a contest he was unseated in favor of his Democratic competitor. He was elected governor of Indiana in 1860, and in the same year became United States senator, serving one term.

LANE, James Henry, American politician and soldier: b. Lawrenceburg, Ind., June 22, 1814; d. Leavenworth, Kans., July 11, 1866. He was admitted to the bar in 1840, enlisted as a private in an Indiana regiment in 1846, served in the Mexican War, became colonel and at Buena Vista commanded a brigade. Returning from the war, he was elected lieutenant governor of Indiana; from 1853 to 1855 was a Democratic representative in Congress; in the latter year removed to Kansas, joined the Free-State Party, acted as president of the Topeka and Leavenworth constitutional conventions and became major general of the Free-State forces. In 1856 the Free-State legislature

elected him to the United States Senate, but he was not allowed to sit. He was a prominent actor in turbulent scenes, and was twice indicted, once for treason and again for murder: on the second charge he was tried and acquitted. In 1861 Kansas was admitted to the Union and Lane was elected United States senator, but entered the Federal army and in the same year was appointed brigadier general of volunteers, serving with ability until March 1862, when his commission was canceled. The "Great Southern Expedition" from Kansas (1861-1862) and other military schemes of the period were conceived by Lane, but came to nothing. As commander for recruiting in the Department of Kansas (1862) he came into collision with the State authorities and was charged with attempted usurpation. In 1865 he was again elected to the United States senate, suffered from paralysis in the following year and died by his own hand.

LANE, Jonathan Homer, American physicist: b. Geneseo, N. Y., Aug. 9, 1819; d. Washington, D.C., May 3, 1880. He was graduated at Yale in 1846 and entered the United States Coast Survey in 1847. He was appointed assistant examiner of the United States Patent Office in 1848 and was principal examiner in 1851-1857. In 1869-1880 he was connected with the Bureau of Weights and Measures in Washington. He was a member of the Coast Survey's expedition to Des Moines, Iowa, to observe the total solar eclipse in 1869, and to Catania, Spain, in 1870. He invented a machine for finding the real roots of the higher equations; a visual telegraph; an improved basin for mercurial horizon; a mechanism for holding the Drummond light and reflector on shipboard, etc.

Among his published works are: *On the Law of Electric Induction in Metals* (1846); *Report of the Solar Eclipse of Aug. 7, 1869* (1869); *Theoretical Temperature of the Sun* (1870); *Coefficients of Expansion of the British Standard Yard Bar* (1877).

LANE, Joseph, American soldier and politician: b. Buncombe County, N. C., Dec. 14, 1801; d. Oregon, April 19, 1881. In 1816 he went from Henderson County, Ky., to Warwick County, Ind., where he was for some time clerk in a mercantile establishment, and in 1822-1846 served in both houses of the State legislature. He resigned from the senate in 1846 to enlist as a private in the 2d Indiana Volunteers, was soon commissioned colonel of the regiment, and in the same year was promoted brigadier general. He was wounded at Buena Vista, defeated Santa Anna at Huamantla and was brevetted major general, U.S.A., for this service. After the Mexican War he was appointed governor of Oregon Territory, was Democratic delegate from Oregon to Congress in 1851-1857, defeated the Rogue Indians at Table Rock in 1853 and in 1859-1861 was a United States senator. He was nominated for the vice-presidency in 1860 on the unsuccessful Breckenridge ticket. He then retired from public life and lived at his ranch in Oregon for the rest of his life.

LANE, Sir Ralph, English administrator in America: b. Northamptonshire, England, about 1530; d. in Ireland, 1603. His early life was

spent in maritime adventure; in 1583-1584 he held a command in Ireland, in 1585 took the direction of the colony that Raleigh was establishing in Virginia, sailed in that year in the fleet commanded by Sir Richard Grenville and was left with 107 colonists at Roanoke Island, while the fleet returned to England (August 25). He was thus the first governor of Virginia. The location proved unsuitable, provisions ran low and there was trouble with hostile Indians. On June 19, 1586 the colony sailed for England in the fleet of Sir Francis Drake. In 1589 Lane was a colonel in Drake's expedition against Portugal, and in 1591 helped to quell a rebellion in Ireland. It is regarded as not unlikely that he and his companions first brought tobacco and potatoes to England. Letters by him may be read in Hawks' *History of North Carolina* (1857); and in Hale (editor), *Archaeologia Americana*, vol. 4 (1860).

Consult also his *Account of the Particularities of the Employments of the Englishmen left in Virginia*, printed by H. S. Burrage in *Early English and French Voyages* (New York 1906).

LANE, Ralph Norman Angell. See ANGELL, SIR NORMAN.

LANE, Rose (Wilder), American writer. b. near DeSmet, Dakota Territory (now South Dakota), Dec. 5, 1887.

She is the author of *Henry Ford's Own Story* (1917); *The Making of Herbert Hoover* (1920); *Let the Hurricane Roar* (1933). Mrs. Lane includes among her published works the once best-seller *White Shadows in the South Seas* (1919) which she claimed she ghost-wrote for Frederick O'Brien (1869-1932). He claimed she acted as his secretary. In 1947 Mrs. Lane translated Bastiat's *The Law*. She is a contributor to many leading magazines.

LANE, William Coolidge, American librarian: b. Newton, Mass., July 29, 1859; d. March 18, 1931. He was graduated at Harvard in 1881 and was assistant librarian there from 1887 to 1893, when he became librarian of the Boston Athenaeum, continuing in that position until 1898, after which he was librarian of Harvard University until 1928. From 1886 to 1900 he served as secretary and treasurer of the publishing board of the American Library Association. In 1898-1899 was president of the association and after 1899 chairman of the publishing board. From 1904 to 1909 he was president of the Bibliographical Society of America.

LANE-POOLE, lān'pōōl', Stanley Edward, English archaeologist: b. London, Eng., Dec. 18, 1854; d. there, Dec. 29, 1931. A nephew of Edward William Lane, the Orientalist (q.v.), he was educated at Corpus Christi, Oxford. In 1874-1892 he was employed in the coin department of the British Museum; was sent by the government on archaeological missions to Egypt (1883) and Russia (1886); was employed by the Egyptian government in archaeological research at Cairo (1895-1897); and from 1898 to 1904 was professor of Arabic in Trinity College, Dublin. His published works include: *Catalogue of the Oriental and Indian Coins in the British Museum*, 14 vols. (1875-1892); biographies of Lord Stratford de Redcliffe, 2 vols. (1888). Sir G. F. Bowen, 2 vols. (1889), Sir Harry Parkes, 2 vols. (1894), Sir R. Church (1890); and E. W. Lane (1877):

The People of Turkey, 2 vols. (1878); *Lane's Koran* (1879); *Arabian Society in the Middle Ages* (1883); *Aurazgib* (1892); *History of the Moghul Emperors of Hindustan* (1892); *The Mohammedan Dynasties* (1894); *Egypt in the Middle Ages* (1901); *Mediaeval India* (1902); *The Story of Cairo* (1902); *The Thousand and One Nights*, 3 vols. (1906); *Mediaeval India from Contemporary Sources* (1916); *A Short History of India in the Middle Ages* (1917); *Watson Pasha* (1919).

LANESSAN, län-ě-săn, **Jean Antoine de**, French naturalist and publicist: b. St. André-de-Cubzac, Gironde, July 13, 1843; d. Nov. 9, 1919. He entered the health corps of the French marine service, after studying medicine at Bordeaux, and was engaged as surgeon on the coast of Africa and China until the Franco-Prussian War. He was elected to the National Assembly in 1881 and came into notice as a Republican journalist. Being interested in colonial matters he was appointed governor general of Indochina in 1891-1894; and his writings have done much to promote French colonization. He was Minister of Marine in the Waldeck-Rousseau Cabinet, 1899-1902. His principal works are *De Protoplasme végétal* (1876); *La Matière, la Vie et les Êtres Vivants* (1879); *L'Expansion Coloniale de la France* (1888); *Principes de Colonisation* (1897); *L'Indo-Chine française* (1899); *La Morale des Religions* (1905); *L'État et les Églises en France depuis les origines jusqu'à la séparation* (1906); *La Lutte contre le Crime* (1910); *Nos Forces Navales* (1911); *Nos Forces Militaires* (1913).

LANETT, city, Ala., in Chambers County; on the Chattahoochee River; 21 miles northeast of Opelika; on the Western Railway of Alabama, and Chattahoochee Valley Railroad. It has cotton mills, bleaching and dyeing plants, and manufactures of sheeting, towels, and other cotton goods. It was called Bluffton until its incorporation in 1893, when it was named for the mill owners, Lanier and Barnett. Pop. (1950) 7,434.

LANFRANC, län'fränk, Anglo-Norman ecclesiastic, the first archbishop of Canterbury after the Norman Conquest: b. Pavia, Italy, about 1005; d. Canterbury, Kent, May 24, 1089. After studying law in his native city he left Italy about 1039 and migrated to Normandy where he founded a school of law at Avranches which soon became famous. In 1042 he entered the Benedictine abbey of Bec, near Rouen, of which in 1045 he became prior, having Anselmo, later Pope Alexander II, as one of his pupils and the duke of Normandy (later William I) as his friend. He at first condemned and then condoned William's marriage with his cousin Matilda of Flanders, and when the duke founded the monastery of St. Stephen at Caen was, in 1066, nominated its first abbot. In 1070 he was made archbishop of Canterbury.

As primate he is remembered for his efforts to purify English monasticism; his zeal for the enforcement of clerical celibacy, though he made an exception in favor of parish priests who had married before the decree of 176; and his works of charity.

After the fire of 1067 he rebuilt Canterbury Cathedral in Norman style; founded the hospital of St. John outside Canterbury, and the leper

house of St. Nicholas, at Harbledown. He crowned William II in 1087, and was on the king's side in the rebellion of 1088.

As a theologian, Lanfranc took a prominent part in the controversy with Bérenger (Bérenger de Tours) in 1050, on the question of transubstantiation. He cleared himself before Pope Leo IX of the charge of sympathizing with Bérenger, and set forth his views in the treatise *De corpore et sanguine Domini*, arguing that the elements in the Eucharist are incomprehensibly converted through consecration into the Body and Blood of Our Lord, while their external form and appearance remain.

His works, including commentaries on the Epistles of St. Paul and Sermons, were edited by J. A. Giles (1844).

Consult Charma, A., *Lanfranc* (Paris 1648); Crozals, J. de, *Lives of the Archbishops of Canterbury*, vol. 2 (Paris 1877).

LANFRANCO, län-fräng'kô, **Giovanni**, Italian historical painter: b. Parma, 1580 or 1581; d. Rome, 1647. He was a page in the service of the Marquis of Montalo, who placed him in the studio of Agostino Carracci at Parma. Later he studied in Rome under Annibale Carracci, assisting him in painting the frescoes in the Farnese Palace. His most notable work was done in fresco painting, although there is a considerable number of his oil paintings in the various Italian collections. He was also an engraver, his most famous work in that line being the plates for Raphael's Biblical subjects in the Vatican.

Among the most famous of his frescoes are his *Angels in Glory*, painted for his old patron, the Marquis of Montalo, in the cupola of Maria in Piazza at Piacenza; the completion of the cupola frescoes of San Andrea della Valle; the cupola of the church of Gesù Nuovo at Naples; and he painted other frescoes in various northern Italian cities. He painted *St. Peter Walking upon the Sea* for St. Peter's Church in Rome and likewise executed a Passion series for the chapel of the Crucifix there. His services to ecclesiastical art were recognized by Pope Urban VIII who knighted him.

LANFREY, län-frä', **Pierre**, French historian and publicist: b. Chembéry, Oct. 26, 1828; d. Pau, France, Nov. 15, 1877. He was educated in the Jesuit college of his native town and in Paris and became well known by the publication of works in support of political and religious liberalism. These include *L'Eglise et les philosophes au XVIII^e siècle* (1855); *Essai sur la révolution française* (1858); *Histoire politique des papes* (1860); *Lettres d'Everard* (1860), a social novel in epistolary form; *Le rétablissement de la Pologne*; and *Etudes et portraits politiques* (1863). His most important work is a *History of Napoleon I* (1867-1875), which is strongly hostile to Napoleon. It was incomplete at his death. In 1871 he was elected to the National Assembly by the department of Bouches-du-Rhône, and took his seat with the Republican Left. He was ambassador at Berne (1871-1873), and in 1875 he was elected a life senator.

LANG, lăng, **Andrew**, English author: b. Selkirk, March 31, 1844; d. July 20, 1912. He was educated at St. Andrews and at Balliol Col-

lege, Oxford; was elected Fellow of Merton, Oxford, in 1868. He was probably the most versatile writer of his time, and was recognized as an authority on many subjects, including Greek, French and English literature, anthropology and folklore, Scottish history (especially the Jacobite period), telepathy and physical research. His wide learning appears in his prose rendering of the 'Odyssey' (1879; with Butcher), and the 'Iliad' (1882; with Myers and Leaf), and 'Homer and the Epic' (1893), a defense of the unity of the poems; in his works on comparative mythology and religion, 'Custom and Myth' (1884), 'Myth, Ritual, and Religion' (1887; new ed., 1899); 'The Making of Religion' (1898), and 'Magic and Religion' (1901); and in his studies of Scottish history, such as 'A History of Scotland from the Roman Occupation'; 'The Mystery of Mary Stuart' and 'Prince Charles Edward.' Some of the most interesting of his work is to be found in 'Letters to Dead Authors' (1886); 'Letters on Literature' (1889); 'Angling Sketches' (1891); 'Essays in Little' (1891); 'Adventures Among Books' (1904). He published also volumes of verse, 'Ballades in Blue China' (1880); 'Rhymes à la Mode' (1884); 'Grass of Parnassus' (1888); 'Ballads of Books' (1888); 'Ban et Arrière Ban' (1894). Mention should also be made of 'Cock-Lane and Common Sense' (1894), a discussion of the spiritualistic question; 'John Knox and the Reformation' (1905); 'A Defence of Sir Walter Scott and the Border Minstrelsy' (1910); and the biographies of Lockhart (1896) and Tennyson (1901). See LETTERS TO DEAD AUTHORS.

LANG, Arnold, Swiss zoologist and anatomist: b. Oftringen, 1855. He was educated at the universities of Geneva and Jena, and in 1876 became privatdocent in zoology at Bern. He was assistant at the zoological station at Naples in 1878-85, and was Ritter professor of phylogeny at Jena in 1886-89. In 1889 he became professor of zoology and comparative anatomy at the University of Zürich, where he died 30 Nov. 1914. He wrote 'Die Polycladen (Seeplanarien) des Golfes von Neapel' (1884); 'Ueber den Einfluss der festsitzenden Lebensweise auf die thieze' (1888); and his 'Lehrbuch der vergleichenden Anatomie' was translated into the English 'Text-book of Comparative Anatomy' (Part I, 1891; part II, 1896).

LANG, Benjamin Johnson, American musician: b. Salem, Mass., 28 Dec. 1837; d. 1909. He studied music under his father, an organist and pianoforte teacher, and at 15 began work as teacher and organist. In 1855 he went to Germany for further study, which for three years he pursued under the instruction of Liszt, Albert Jaell and others. Returning to Boston he at once attained prominence as organist, pianist, teacher and conductor; became organist of the Handel and Haydn Society in 1859 and conductor of the same in 1895; conductor of the Apollo Club in 1868, and of the Cecilia Society in 1874. In 1869 he made a second visit to Europe, and gave concerts in Berlin and other cities. As a member of the concert committee of the Harvard Musical Association he did much in the interest of musical culture, and through this and other organizations secured the production of many new works. The intro-

duction of Wagner to the American public was in no small part due to his presentation of that master. He also introduced in America Mendelssohn's 'Walpurgis Night' and Berlioz's 'Damnation of Faust.' While he accomplished much work as a composer, few of his compositions have been published.

LANG, Cosmo Gordon, English archbishop: b. Aberdeenshire, Oct. 31, 1864; d. Richmond, Surrey, Dec. 5, 1945. As an undergraduate he had a brilliant career at Glasgow University, at Balliol College, Oxford; and was a student of the Inner Temple, London, 1883-89. He became a Fellow of All Souls' College, Oxford, in 1888, and attained the degrees of D.D., D.C.L., LL.D., and D.Litt. He was curate at Leeds 1890-93; fellow and dean of Divinity, Magdalen College, Oxford, 1893-96; vicar of Saint Mary's,—the university church,—Oxford, 1894-96; vicar of Portsea, 1896-1901; bishop of Stepney, 1901-08; canon of Saint Paul's, 1901-08; and honorary chaplain to the late Queen Victoria. He was created archbishop of York in 1908 and at the confirmation held in the Church House Jan. 20, 1909 objections were raised on behalf of the Protestant Truth Society on the ground that while bishop of Stepney he had allowed infractions of the law as to church ritual. The objections were dismissed by the commissioners in chambers presided over by the archbishop of Canterbury, on the technical grounds 'that they could not be lawfully received.' He became archbishop of Canterbury in 1928.

LANG, Heinrich, German-Swiss theologian and reform leader: b. Frommern, Württemberg, 14 Nov. 1826; d. Zürich, 13 Jan. 1876. He was educated in theology at the University of Tübingen and took part in the uprising of 1848, for which he was banished. He became pastor of Wartau, Switzerland, and won wide recognition for his advocacy of the Reformed Church. He later became pastor of the church at Meilen. He established a paper called *Die Zeitstimmen aus der reformirten Kirche der Schweiz* which he later combined with Bitzius' *Berner Wochenblätter* under the new name *Reform*. He opposed the old doctrines of the orthodox church, and was untiring in his efforts to promote broader views. He wrote 'Versuch einer christlichen Dogmatik' (1858; 2d ed., 1868); 'Ein gang durch die christliche welt' (1859; 2d ed., 1870), and 'Religiöse Reden' (2 vols., 1873-74; 2d ed., 1896).

LANG, John Marshall, Scottish Presbyterian clergyman and educationist: b. Glasford, Lanarkshire, 14 May 1834; d. Aberdeen, 2 May 1909. After completing his education at Glasgow University he filled successively several important charges, and was minister of the Barony parish in Glasgow from 1873-1900. He was moderator of the Church of Scotland in 1893. He was the author of several devotional and other religious works. His third son, Cosmo Gordon Lang (q.v.), was appointed archbishop of York (1909). In 1900 he was appointed vice-chancellor and principal of Aberdeen University.

LANG, Karl Heinrich Ritter von, German historian: b. Balgheim, near Nördlingen, 7 July 1764; d. Aurbach, 26 March 1835. He was educated at the universities of Altdorf and Göttingen, specializing in history and jurispru-

dence. In 1789 he was private secretary to Baron von Bühler, Wurtemberg's envoy at Vienna; he traveled and studied extensively, and from 1793–1801 he was private secretary and archivist to the Prussian leader Hardenberg. In 1797 he was secretary of the legation at the Congress of Rastadt. He was ennobled in 1808 and in 1810–17 was archivist in Munich, retiring in 1817. His dependability as a historian is lessened by his tendency to satire and his giving rein to personal prejudices. Among his many works are 'Memorien' (Brunswick 1842; 2d ed., 1881); 'Beiträge zur Kenntnis der natürlichen und politischen Verfassung des oettingischen Vaterlandes' (1786); 'Neuere Geschichte des Fürstentums Bayreuth' (1798–1811); 'Bayerns Gauen' (1830).

LANGBAINE, lāng'bān, **Gerard** (LANGBAINE THE YOUNGER), English dramatic biographer and critic: b. Oxford, 15 July 1656; d. there, 23 June 1692. He was the son of Gerard Langbaine, provost of Queen's College, Oxford, and was educated at University College, Oxford. For years he trifled with literary pursuits and in November 1687 a work appeared under Langbaine's name entitled 'Momus Triumphans, or the Plagiaries of the English Stage Exposed in a Catalogue of Comedies, Tragedies, etc.' A month later the work reappeared as 'A New Catalogue of English Plays,' the advertisement disclaiming responsibility for the title of the first edition and for an uncorrected preface. Langbaine attributed the unauthorized edition with its derisive title to the malice of Dryden. At this time Langbaine had collected 980 English dramatic works. He later wrote 'An Account of the English Dramatic Poets, etc.' (Oxford 1691), which is his best-known and most valuable compilation. He was elected yeoman bedel of arts at Oxford in 1690 and esquire bedel of law and architypographus in 1691.

LANGBEIN, lāng'bēin, **August Friedrich Ernst**, German humorist: b. Radeburg near Dresden, 6 Sept. 1757; d. Berlin, 2 Jan. 1835. He was educated for the law at Leipzig and engaged in practice in Dresden until 1800 when he went to Berlin to enter upon a literary career. Both his verse and prose are of a rollicking humorous cast and were widely popular. He wrote 'Schwänke' (1792; 2d ed., 1888); 'Thomas Kellerwurm' (1806); 'Sämmtliche Schriften' (1835–37); 'Humoristische Gedichte,' edited by Tittmann (1872); 'Humoristische Erzählungen' (1891). Many of his poems enjoyed a lasting popularity as songs.

LANGDALE, Marmaduke, **BARON**, English soldier: b. near Beverley, about 1598; d. Holme, 5 Aug. 1661. He came into public notice in 1639 when he opposed the ship-money levy on Yorkshire, but when the Civil War began he espoused the cause of King Charles I, and in 1643 he raised a regiment to fight for him. He afterward became a commander of cavalry, defeated the invading Scottish army at Corbridge, Northumberland, 19 Feb. 1644, and later fought at Marston Moor. He was victorious at Melton Mowbray 25 Feb. 1645; and succeeded in raising the siege of Pontefract on 1 March 1645, a piece of work regarded as perhaps the most brilliant of his career. He was defeated at Naseby, at Rowton Heath and at Sherburn; and the battle of Carlisle completely shattered

the remnant of his 1,500 horsemen so that he was compelled to flee to the Isle of Man, whence he escaped to France in May 1646. In the second Civil War he returned to Scotland with a commission from Charles II, and on 28 April 1648 he surprised Berwick and quickly raised a body of Royalists. He was defeated by Cromwell's army at Preston, 17 Aug. 1648, and was taken prisoner 25 August. He was one of seven persons debarred from pardon by Parliament, but he succeeded in escaping from prison. He entered the Venetian service and was prominent in the defense of Candia against the Turks in 1652. After the Restoration Charles II created him a peer. His estates had been confiscated by Parliament, his losses in the service of the king amounting to £160,000, and he excused himself from the coronation ceremonies in 1661 on the ground of poverty.

LANGDELL, Christopher Columbus, American lawyer: b. New Boston, Hillsborough County, N. H., 22 May 1826; d. Cambridge, Mass., 6 July 1906. He studied at Harvard, was graduated from its law school in 1853, in 1853–70 practised in New York, in 1870 became professor of jurisprudence in the Harvard Law School, and in 1871 dean of the law school faculty. In 1895 he retired. He was an originator of the so-called "case" system of legal study, and was otherwise prominently identified with the progress of professional education in this country. His publications include 'Selection of Cases on the Law of Contracts' (1870; enlarged ed., 1877); 'Cases on Sales' (1872); 'Summary of Equity Pleading' (1877; 2d ed., 1883), and 'Cases in Equity Pleading' (1878); 'Brief Survey of Equity Jurisprudence' (1904).

LANGDON, John, American statesman: b. Portsmouth, N. H., 25 June 1739; d. there, 18 Sept. 1819. At the outbreak of the Revolutionary War he embarked in the patriotic cause, and in 1775 he was a delegate to the Continental Congress, but resigned office in June 1776, on becoming navy agent. In 1777, while speaker of the New Hampshire assembly, he pledged a large portion of his property for the purpose of equipping the brigade with which Stark defeated the Hessians at Bennington. He took part in the battle of Stillwater and commanded a company at Saratoga and in Rhode Island. Subsequently he was a member and speaker of the State legislature, a member of the Continental Congress, a delegate to the convention which framed the Constitution of the United States, and president of New Hampshire. He was one of the first United States senators from New Hampshire, which office he held until 1801, serving for a time as president of the Senate. In politics he acted with Jefferson, who upon assuming office in 1801 offered him the post of Secretary of the Navy, which he declined. From 1805 to 1812, with the exception of about two years, he was governor of New Hampshire; and in 1812 he was offered by the Republican congressional caucus the nomination for the office of Vice-President of the United States, which, on the score of age and infirmities, he declined. The remainder of his life was passed in retirement.

LANGDON, Samuel, Congregational clergyman and educator: b. Boston, Mass., 1723;

d. Hampton Falls, N. H., 1797. He was graduated from Harvard in 1740 and was pastor at Portsmouth, N. H., 1747-74. In 1774 he became president of Harvard, resigning in 1780. In the New Hampshire Convention he ardently advocated the ratification of the Federal Constitution. He received the degree of D.D. from Aberdeen in 1762. Langdon was the author of several works on religion and philosophy.

LANGE, lǎng'ě, **Ernst Philipp Karl** (PHILIPP GALEN), German novelist: b. Potsdam, 21 Dec. 1813; d. there, 20 Feb. 1899. He took his degree in medicine at Berlin, became a surgeon in the Prussian army in 1840, saw service in the Schleswig-Holstein campaign of 1849 and afterward settled at Bielefeld, where he practised medicine and began his literary career. He retired with the rank of surgeon-general in 1878. He wrote 'Der Inselkönig' (1852; 3d ed., 1858); 'Der Irre von Saint James' (1854; 9th ed., 1891); 'Walter Lund' (1855); 'Die Tochter des Diplomaten' (1865); 'Die Moselnixe' (1877); 'Der Meier von Monjardin' (1891), etc. His 'Gesammelte Schriften' was published in 36 volumes (1857-66).

LANGE, Friedrich Albert, German sociologist and economist: b. Wald near Solingen, 28 Sept. 1828; d. Marburg, 23 Nov. 1875. He was educated at Dinsberg, Zurich and Bonn, and became privatdocent in philosophy at Bonn in 1855. In 1858 he became schoolmaster at Duisberg, but resigned upon the government forbidding schoolmasters to partake in political activities, and entered journalism in the cause of political and social reform. He was a bitter opponent of Bismarck's ministry. In 1866 he removed to Winterthur near Zurich, where he was connected with the *Winterthurer Landbote*. He became privatdocent at Zurich in 1869 and professor of inductive philosophy in 1870. His strong sympathy with the French in the Franco-Prussian War influenced his resignation from Zurich but he afterward abandoned politics. In 1872 he became professor at Marburg. He wrote 'John Stuart Mills Ausichten über die sociale Frage' (1866); 'Geschichte des Materialismus' (1867; 8th ed., 1908); 'Logische Studien' (1877; 2d ed., 1894), etc.

LANGE, Henry, German cartographer: b. Stettin, 13 April 1821; d. Berlin, 20 Aug. 1893. He was for three years engaged upon Johnson's Physical Atlas in Edinburgh and in 1855-60 he was head of the geographical department of Brockhaus in Leipzig. He was appointed inspector in the Berlin Statistical Bureau in 1868. Among his publications are 'Atlas vom Nordamerika' (1854); 'Brockhaus Reise-atlas' (1858-73); 'Südbrasilian, mit Rücksicht auf die deutsche Kolonization' (1885), etc.

LANGE, Johann Peter, German theologian: b. Sonneborn near Elberfeld, 10 April 1802; d. Bonn, 9 July 1884. He studied at Bonn, held several pastorates and in 1854 became professor of theology at Bonn. He was one of the editors of the 'Theologische-homiletisches Bibelwerk,' which was translated, edited and enlarged under the direction of Dr. Philip Schaff as 'A Commentary on the Holy Scriptures, Critical, Doctrinal and Homiletical' (25 vols., New York 1865-80). He wrote 'Christliche Dogmatik' (3 vols., 1849-52;

new ed., 1870); 'Grundriss der theologischen Encyclopädie' (1887); 'Grundriss der christlichen Ethik' (1878); 'Grundriss der Bibelkunde' (1881), etc.

LANGE, lǎng'ě, **Julius Henrik**, Danish art critic: b. Vordingborg, 19 June 1838; d. Copenhagen, 20 Aug. 1896. After leaving the University of Copenhagen he traveled in Italy, and thereafter devoted himself to study of the history of art, becoming in 1888 professor in that subject at Copenhagen University. Among his works are 'On Art Values' (1876); 'Danish and Foreign Art' (1879); 'Gods and Men in Homer' (1881); 'Art and Politics' (1885); 'Bastien Lepage and Other Painters' (1889); 'Thorwaldsen's Representation of the Human Figure' (1893). In his 'Billedkunstens Fremstilling at Menneskeskikkelser' (3 vols., 1892-99) he elaborates his discovery of the "Law of Frontality." Consult Brandes, G., 'Julius H. Lange' (Copenhagen 1898).

LANGE, Thomas, Danish novelist: b. Copenhagen, 1829; d. Lyngby, 1887. He studied theology but abandoned it for a literary career. His work ranks nearly equal to that of his contemporary countryman, Goldschmidt. His first successful novel was 'Eventyrets Land' (1865). Later writings include 'Aaen og havet' (1870); 'Romantiske skildringer' (1872); 'De lyse Nætter' (1875); 'Nyt Liv' (1879), etc.

LANGE, Thor Næve, Danish author and translator: b. Copenhagen, 1851; d. 1915. He studied at the University of Copenhagen and took his Ph.D. there in 1894. He became a professor at Moscow in 1877 and in 1887 he was Danish consul there. His work includes some excellent poetry and prose work besides translations of verse from the French, Italian, Greek, Russian and English. His 'Skildringer fra den russiske Literatur' (1886) ranks as a notable production. He wrote 'En Maaned i Orienten' (1887); 'Skizzer og Phantasier' (1890); 'Gennem farvet Glas' (1894); 'I danske Farver' (1907), etc.

LANGELIER, lǎnz'h'lyǎ', **SIR FRANCOIS Charles Stanislas**, Canadian jurist and statesman: b. Saint Rosalie, Quebec, 24 Dec. 1838; d. 8 Feb. 1915. He was educated at Saint Hyacinthe College, Laval University and the Law Faculty of Paris, and was professor of Roman law and afterward of civil law and economics at Laval University. He served in the Canadian House of Commons in 1884-98; was Minister of Crown Lands, Quebec, 1878-79; mayor of Quebec in 1882-90; and puisne justice of the Superior Court in 1898-1907. He was acting chief justice of the Superior Court of the province of Quebec division in 1906-11; and from 1911 he was lieutenant-governor of the province of Quebec. He was knighted in 1907. He published 'De La Preuve en Matière Civile et Commerciale'; 'Commentaire du Code Civil de la Province Quebec.'

LANGEN, Joseph, German theologian: b. Cologne, 3 June 1837; d. Bonn, 13 July 1901. He studied at the University of Bonn and was ordained a priest in 1859. He became assistant professor in 1864 and in 1867 professor of the exegesis of the New Testament at Bonn, a

position he held for the remainder of his life. In 1870 he supported Döllinger in his controversy with the Vatican and was excommunicated. He left the Old Catholic Church in 1878 because of the permission to marry which was given priests, but he was never reunited with the Roman Catholic Church. His writings, which made him well known, include 'Introduction to the New Testament' (1868; 2d ed., 1873); 'An Examination of the Vatican Dogma in the Light of Patristic Exegesis of the New Testament'; 'History of the Church of Rome to the Pontificate of Innocent III' (4 vols., 1881-93), etc. He also contributed to the *International theologische Zeitschrift*.

LANGENBECK, lǎng'ĕn-bĕk, **Bernhard Rudolph Konrad** von, German surgeon: b. Pardingbüttel, 8 Nov. 1810; d. Wiesbaden, 29 Sept. 1887. He took his degree at Göttingen in 1835. He traveled in France and England, returned to Göttingen as privatdocent and in 1842 became professor of surgery at Kiel. He succeeded Dieffenbach as director of the Clinical Institute for Surgery and Ophthalmology at Berlin, serving there in 1848-82, when he retired. He was a daring and skilful surgeon and made a reputation in facial surgery, as well as in resection, an operation on the bone which frequently obviates amputation of a limb; and in the treatment of gunshot wounds he was an authority. He was general field surgeon of the army in the war with Denmark in 1848, served in 1864-1866 and in the Franco-Prussian War of 1870-71. He was ennobled for his services in the Danish War. He published 'Chirurgische Beobachtungen aus dem Kriege' (1874).

LANGENBECK, Karl, American ceramic chemist: b. Cincinnati, Ohio, 7 Oct. 1861. He studied under Victor Meyer in Zürich and under Carl Liebermann in Berlin. He was superintendent of the Rockwood Pottery in Cincinnati in 1885-90, and is the originator of the Rockwood faience and aventurin pottery glazes. In 1888-90 he was professor of chemistry at Miami Medical College; chief ceramist, U. S. Tariff Commission for pottery and glass manufactures, 1922-24; consulting ceramic engineer, U. S. Bureau of Standards, from 1924. He wrote 'Chemistry of Pottery' (1895).

LANGENBECK, Konrad Johann Martin, German surgeon: b. Horneburg, 5 Dec. 1776; d. 24 Jan. 1851. He studied at Jena, Vienna and Würzburg and took his degree at Göttingen in 1802. He was appointed professor at Göttingen in 1804. He was eminently successful both as a surgeon and as a teacher. He founded and edited the *Bibliothek für Chirurgie und Ophthalmologie* (1806-28). He was the father of MAXIMILIAN ADOLPH LANGENBECK (1818-77), also famous as a surgeon and uncle of BERNHARD RUDOLPH KONRAD VON LANGENBECK (q.v.).

LANGENDIJK, lǎng'ĕn-dĭk, **Pieter**, Dutch poet and dramatist: b. Haarlem, 1683; d. 1756. He was by trade a designer of textile patterns, but turned to literature, in which he achieved considerable success. His work includes a number of dramas, chiefly comedies, some of which are still produced, and he was the author of numerous poems. His works include 'Don Quichot' (1696); 'De Zwetser' (1712); 'Het

wederzyds huwelyksbedrog' (1714); 'Kreislouwen' (1715); 'Quincapox of de windhaudelaars' (1720); 'Xantippe of Het boose wyf des filosoofs Socrates beteugeld' (1756), etc. His poems were published in his collected works, 'Gedichten' (1760). Consult Van Hampen, 'Histoire des lettres Neerlandaises' (1821-26); Meijer, 'Pieter Langendijk' (1891).

LANGENSALZA, lǎng'ĕn-zǎl'tsǎ, Prussia, city in the province of Saxony, on the Salza, 19 miles northwest of Erfurt. It became a town in 1211, was subsequently part of the electorate of Saxony, and in 1815 came into Prussian possession. Near it are the remains of the Benedictine monastery of Hohenburg, where Henry IV was victorious over the Saxons in 1075. It was the field of three other famous battles; the defeat of the imperial army by the Prussians and English, 15 Feb. 1761; the victory of the Prussians over the Bavarians 17 April 1813, and the defeat of the Prussians by the Hanoverians 27 June 1866, the results of this battle being reversed by the arrival of Prussian reinforcements 29 June. The modern town is chiefly engaged in the textile industries. There are sulphur springs in the vicinity. Pop. 12,663.

LANGENSCHIEDT, lǎng'ĕn-schĭt, **Gustav**, German philologist and publisher: b. Berlin, 21 Oct. 1832; d. there, 11 Nov. 1895. He was an extensive traveler and the originator with Charles Toussaint of the Toussaint-Langenscheidt method of self-instruction in languages. The first textbook of the series, 'Französische Unterrichtsbriefe zum Selbststudium' (1856) reached its 62d edition in 1902. He was assisted by Karl von Dalen and Henry Lloyd in the preparation of 'Englisch Unterrichtsbriefe.' He published also the 'Sachs-Villatte Französisch-deutsches Wörterbuch' (1868-94); the Muret-Sanders 'Encyclopädie Wörterbuch der Englisch und deutsche Sprache' (1891-1901), etc. The system was founded on the Hamilton-Jacotot method and has been widely adopted for use in different languages.

LANGEVIN, lǎnzh-vǎn, **Sir Hector Louis**, Canadian statesman: b. Quebec, 26 Aug. 1826; d. 1906. He was called to the bar in 1850. He entered Parliament during the Union period and on Confederation was appointed Secretary of State; was subsequently Minister of Public Works (1869-73); Postmaster-General (1878); and again Minister of Public Works (1879-91). He retired from public life in 1891.

LANGEVIN, Jean François Pierre La Force, zhōn frāñ-swǎ pē-ār lǎ fōrs, French-Canadian Roman Catholic bishop: b. Quebec, 22 Sept. 1821; d. 26 Jan. 1892. He was educated at the Quebec Seminary, was ordained priest in 1844 and consecrated bishop of Rimouski in 1867. In 1870 he founded the College of Rimouski. Among his publications were 'Histoire du Canada en Tableaux' (1860); 'Cours de Pédagogie' (1865).

LANGEVIN, Louis Philip Adelard, Canadian Roman Catholic prelate: b. Saint Isidore, La Prairie County, Quebec province, 23 Aug. 1855; d. Montreal, 15 June 1915. He was educated in theology at the Sulpician College, Grand Seminary, and Saint Mary's College,

Montreal; was ordained in 1882; was appointed professor of theology in the University of Ottawa 1885; and in 1893 became rector of Saint Mary's Church, Winnipeg. He was consecrated archbishop of Saint Boniface, 19 March 1895. He played a conspicuous part in the separate schools controversy in Manitoba.

LANGHAM, Simon de, English archbishop and cardinal: b. Langham, about 1310; d. Avignon, 22 July 1376. He became a monk, then prior and later abbot in the abbey of Saint Peter at Westminster. He was appointed treasurer of England in 1360 and in 1361 became bishop of Ely. He was chancellor of England in 1363, and in 1366 was elected archbishop of Canterbury. He expelled the secular clergy, headed by John de Wiclif, from their college at Canterbury Hall, Oxford, and as chancellor of England took part in the antipapal measures of 1365-66. He was nevertheless made a cardinal by Urban V in 1368, but his acceptance cost him the favor of Edward III and he was compelled to resign his archbishopric. He retired to Avignon, soon held other offices of the Church and in 1374 was again offered the archbishopric of Canterbury, but declined it. He left his estate to Westminster Abbey, where his tomb is the oldest monument to an ecclesiastic.

LANGHORNE, John, English poet and translator of Plutarch: b. Kirkby Stephen, Westmoreland, March 1735; d. Blagdon, 1 April 1779. He entered Clare Hall, Cambridge, in 1760, and having taken orders became a curate at Dagenham in Essex in 1761, and rector of Blagdon, Somerset, in 1766. In 1777 he was installed a prebendary of Wells Cathedral. He wrote verses and stories once popular, but he is remembered now only by the translation of Plutarch's Lives which he made with his brother William (1721-72). This work, originally published in six volumes in 1770, has passed through many editions.

LANGLADE, län'gläd', Charles Michel de, French-Canadian soldier and pioneer, known as "the founder and father of Wisconsin:" b. Mackinaw, Mich., May 1729; d. Green Bay, Wis., January 1800. His mother was the daughter of an Ottawa chief, and as head of the Ottawas he carried out the ambushade which resulted in the defeat of General Brad-dock in 1755. He was in the service of the French at Fort Duquesne; and in 1757 he joined Montcalm with a band of Ottawas, rendering services at Fort George for which he was made second in command at the military post at Mackinaw. He was with Montcalm at the siege of Quebec, was in the battle of the Plains of Abraham, and in 1760 fought under Chevalier de Levis. At the outbreak of the American Revolution he joined the British at the head of a large body of Indians. When the Indians deserted General Burgoyne after the severe reprimand which followed the murder of Jane McCrea, Langlade was forced to accompany them; but while Burgoyne bitterly blamed him the British government did not confirm the charges. He was appointed Indian agent in 1780 and later became Indian superintendent and commander-in-chief of the Canadian militia. He held these offices until his death, and received a life annuity of \$800 from the British government. He was a man

of unquestioned integrity, and inspired sentiments of warm regard of which traditions still linger in Wisconsin.

LANGLANDE, län'länd, LANGE-LANDE, or LONGLAND, William, English poet: b. Cleobury Mortimer, about 1332; d. about 1400. Little is known of him except from tradition, according to which he was educated at Oxford, and became a monk of Malvern. The familiarity of the author with the Scriptures and the Church fathers indicates that he was an ecclesiastic; several local allusions in the poem, and the fact that its scene is the "Malverne Hilles," prove that it was composed on the borders of Wales; and internal evidence fixes its date at about 1362. It narrates the dreams of Piers Ploughman, who, weary of the world, falls asleep beside a stream in a vale among the Malvern hills; and while satirizing in vigorous allegorical descriptions the corruptions in church and state, and the vices incident to the various professions of life, and painting the obstacles which resist the amelioration of mankind, presents the simple plowman as the embodiment of virtue and truth, and the representative of the Saviour. Its ancient popularity appears from the large number of MS. copies still extant, most of them belonging to the latter part of the 14th century. It was a favorite of religious and political reformers, and several imitations of it appeared, the most important of which was 'Piers Ploughman's Crede,' written about 1393 by some Wycliffite, assailing the clergy, and especially the monks. In 1550 the 'Vision of Piers Ploughman' was printed by the reformers, and so favorably received that three editions were sold within a year. This poem is a remarkable example of a system of verse, derived from the Anglo-Saxons, and marked by a regular alliteration instead of rhyme. There are two classes of manuscripts, which give the text with considerable variations. The best edition both of the 'Vision' and the 'Crede' is that of Wright (1856; new ed., 1897); and of the 'Vision,' that of Skeat (1886). Consult Jusserand, 'Piers Plowman; a Contribution to the History of English Mysticism' (1893); Stubbs, C. W., 'The Christ of English Poetry' (New York 1906).

LANGLÈS, Louis Mathieu, French Orientalist: b. Perrenes, 23 Aug. 1763; d. 28 Jan. 1824. He was educated at Paris, specializing in Oriental languages. He translated the 'Instituts politiques et litteraires de Tamerlan' from the Persian in 1787; and edited the 'Alphabet tartare-mandchou' of Father Amvot in 1789-90. He was instrumental in the establishment of the School of Oriental Languages in Paris in 1795; and was its first administrator, as well as professor of Persian. He was author of many studies of Oriental literature, and the founder of the Paris Geographical Society.

LANGLEY, John Newport, English physiologist: b. Newbury, 1852; d. Cambridge, 5 Nov. 1925. Educated at Saint John's College, Cambridge, he received a fellowship at Trinity College, Cambridge, where he was lecturer in 1884-1903, also serving as university lecturer; and later became professor of physiology at Cambridge. He was a member and officer of many English, American and Continental scientific societies;

was royal medalist of the Royal Society in 1892, and was awarded the Baly Medal of the Royal College of Physicians in 1903. He contributed extensively to scientific journals, and edited the *Journal of Physiology*.

LANGLEY, Samuel Pierpont, American astronomer, physicist and pioneer designer of airplanes: b. Roxbury, Mass., Aug. 22, 1834; d. Aiken, S. C., Feb. 27, 1906. He was graduated from a high school, studied architecture and civil engineering and, after a two years' trip abroad, became an assistant in the Harvard Observatory in 1865. Later he was assistant professor of mathematics in the United States Naval Academy, and in 1867 was appointed director of Allegheny Observatory. In 1887 he became secretary of the Smithsonian Institution. He organized in 1881 an expedition to Mount Whitney, Calif., where he was successful in re-establishing the color constant, and in extending the invisible solar spectrum. He also devised the bolometer, or thermic balance, a contrivance for detecting minute differences of radiant heat and measuring accurately to less than one ten-thousandth of a degree Fahrenheit. He established the Astrophysical Observatory and the National Zoological Park at Washington and in 1887 was president of the American Association for the Advancement of Science. His name became generally known through his experiments in connection with the problem of mechanical flight. In 1896 a motor driven airplane designed by him accomplished the first sustained flight. Further experiments were not so successful, but his design of apparatus has been shown to be correct; in fact, in 1914, Glenn Curtiss installed a more powerful engine in Langley's machine of 1903 and made a successful flight with it at Hammondsport, N. Y. Congress voted Langley \$5,000 to carry out his ideas. Criticism and lack of support led him to abandon his experiments, which, if persevered in, would have been successful eventually, as aeronautical engineers now recognize the correctness of Langley's reasoning and the value of his contributions in this field of science. Among his writings are *The New Astronomy*; *Experiments in Aero-Dynamics*, and *Internal Work of the Wind*.

LANGLEY, Walter, English painter: b. Birmingham, 1852; d. Cornwall, 1922. He attended the National School, Birmingham, qualified as a lithographer, meanwhile studying in the local school of art. He there gained the national scholarship and studied at South Kensington for two years; settled in Newlyn, Cornwall, 1882. Among his watercolor paintings are *Among the Missing*; *Departure of the Fleet*; *Disaster*; *After the Storm*. His oil paintings include *Never Morning Wore to Evening but Some Heart Did Break*; *Motherless*; *Breadwinners*, and *Between the Tides*.

LANGMUIR, Iäng'mür, Irving, American scientist: b. Brooklyn, N. Y., Jan. 31, 1881. He studied at Columbia School of Mines (Met. E., 1903) and at the University of Göttingen, Germany (Ph.D. in chemistry, 1906). He taught chemistry at Stevens Institute of Technology, Hoboken, N. J. (1906-1909), resigning to become research chemist and physicist at the General Electric Company Research Laboratory

at Schenectady, N. Y., where he became assistant director in 1909, and associate director from 1932 until his retirement in 1950.

His researches have resulted in the development of the modern nitrogen- and argon-filled incandescent light bulb (1912; see also *ELECTRIC LIGHTING*); acoustic devices for submarine detection (1917-1918); the atomic hydrogen welding torch (1924-1927); the high-vacuum transmitting tube; and the high-vacuum mercury pump (see also *VACUUM PUMPS*). His contributions, with those of Gilbert N. Lewis, to atomic theory and the understanding of atomic structure, threw light upon the meaning of isotopes. Langmuir's most important recent experimentation (1947-), in collaboration with Dr. Vincent J. Schaefer, has led to the artificial stimulation of rainfall by spraying dry ice and silver iodide into moisture-bearing clouds.

Author of *Phenomena, Atoms, and Molecules* (New York 1950). Langmuir received the Nobel Prize in chemistry in 1932 for his theoretical work relating to the structure of matter and surface chemistry.

LANGREO, läng-grä'ô, commune, Spain, in the province of Oviedo on the river Nalon, 18 miles from the coast and 14 miles southeast of Oviedo on a branch railway from Oviedo to Labiana. Its chief industries are the mining of coal, and iron ore, and the manufacture of iron products. The surrounding country produces fruit, wheat, and hemp. Pop. (1941 est.) 43,797.

LANGRES, län'gr' (ancient ANDEMATUNUM, later LINGONES), commune, France, in the Department of Haute-Marne, 21 miles southeast of Chaumont on the eastern railway to Belfort. It is situated on Langres Plateau which is famous in military history as a commanding strategic point. Under Roman rule it was practically autonomous until the revolt of Sabinus reduced it in rank to a colony in 71 A.D. The cathedral of St. Mammes was built in the 12th century, and the church of St. Martin in the 13th, 15th and 18th centuries. There is a Gallo-Roman gate, a museum of Gallo-Roman antiquities, a picture gallery, and library. The town has a higher ecclesiastical seminary, and communal colleges for both sexes. The industries of the town include a famous line of cutlery and textile manufactures, together with a trade in grain and oil. Pop. (1931) 7,558.

LANGSIDE, läng'sid, village, Scotland, forming a suburb two miles south of Glasgow. It is famous as the scene of the battle in which the regent James Stuart, Earl of Murray (q.v.) on May 13, 1568 defeated the forces of Mary, Queen of Scots and forced her flight to England where she was made prisoner and held until her execution. The battle lasted only three-quarters of an hour.

LANGSON, läng'sôn', town, French Indochina, of the Province of Langson in Tonkin, 85 miles northeast of Hanoi, on the railway between there and Lungchow in the Chinese province of Kwangsi. The town has a citadel and was the scene of two battles in which the French were first defeated by and in turn defeated the Chinese in 1885, since when it has belonged to the French.

LANGSTON, John Mercer, American educator: b. in Louisa County, Va., 14 Dec. 1829; d. Washington, D. C., 15 Nov. 1897. He was born a slave, but when six years old was emancipated, and in 1849 was graduated at Oberlin College, where he was also (1853) a graduate in theology. Admitted to the bar in Ohio (1854), he practised law in that State for 13 years, and in 1869 was appointed professor of law at Howard University, Washington, D. C.; became dean of the law department, and in 1873 vice-president of the university. In 1871 he was appointed a member of the board of health of the District of Columbia, and was afterward elected secretary of the District. From 1877 to 1885 he was United States Minister and consul-general in Haiti, and when he returned to this country he was made president of the Virginia Normal and Collegiate Institute at Petersburg. He was elected to Congress in 1888. He published 'Freedom and Citizenship,' a collection of addresses (1883).

LANGTON, Stephen, English cardinal: b. about 1150; d. Slindon, Sussex, 9 July 1228. He was educated at Paris, and while on a visit to Rome in 1206 Innocent III created him a cardinal and nominated him to the see of Canterbury, consecrating him archbishop next year. King John refused to allow Langton to take possession of his see, and it was not till England had been placed under an interdict, John excommunicated and threatened with deposition, that the king yielded. Langton was acknowledged in 1213, and in August joined the insurgent barons, and acted with them in compelling John to sign Magna Charta. He crowned Henry III, and in 1223 demanded of him the full execution of the charter. He was the author of some theological treatises, and the division of the Bible into chapters has usually been attributed to him. Consult Hook, 'Archbishops of Canterbury' (1862).

LANGTRY, Lily, English actress: b. island of Jersey, 1852; d. 21 Feb. 1929; daughter of the Rev. W. C. Le Breton, dean of Jersey, and as the 'Jersey Lily' (a name given by Millais to the portrait of her which he had painted) was famous for her singular beauty and social graces. She was married to Edward Langtry in 1874. In 1881 she made her first appearance on the stage at the Haymarket Theatre in 'She Stoops to Conquer.' She paid several professional visits to the United States, and in 1903 she starred in 'The Crossways,' a play written by herself in collaboration with J. Hartley Manners. In 1899 she was married to Sir Hugo de Bathe, Bart.

LANGUAGE. See ETYMOLOGY; LANGUAGE, SCIENCE OF; SPEECH; WRITING.

LANGUAGE, Science of. Language in its broadest sense is any means of expressing thought. The cries of the lower animals are language in so far as they give expression to their state of mind, there is a language of flowers and so on. The present article deals with only one form of language, i.e., human speech. The Science of Language in this narrower sense (also called *Linguistics*) comprises three branches: (1) General Linguistics; (2) Comparative Philology; (3) Special Grammar. The object of the *General Linguistic* is to ascer-

tain the fundamental laws and characteristics of the language processes by the examination and comparison of all the languages available for this purpose. This branch interprets the phenomena observed in the light of the known laws of psychology, physiology and physics. It lays the foundations for all the branches of language study. *Comparative Philology* has a narrower field, being limited to the comparison of languages of kindred origin. Its purpose is to determine the genetic relationships between such languages. Examples are Indo-European Comparative Philology, Comparative Philology of the Bantu languages, of the Semitic languages, etc. *Special Grammar* is of two types, historical and systematic. The latter offers a systematic classification and description of the forms and usages of any given language or dialect at some definite period of its life, e.g., the grammar of Modern English, of Chaucer's English, of Hellenistic Greek. Historical grammar aims to explain the development of a given language from generation to generation.

A. GENERAL LINGUISTICS.

Description of the Language Processes.—

It is customary to define language as articulate sounds expressive of ideas. While such a definition may satisfy the popular curiosity, it is extremely inadequate. As a matter of fact, language is a complex series or group of nervous, muscular and physical processes. It is a well-known fact that the nervous system is made up of a great many groups of nerve cells. Each group performs some special function. For example, one part of the brain receives the impressions from the eye, another from the ear and so on. In particular from one area on each side of the brain run fibres which reach either directly or indirectly (by relays) all the muscles of the body. When we wish to give utterance to an idea, we set up (in some way not fully understood) a nervous activity in that portion of this "motor area" which controls the muscles that must be moved in order to produce the required sounds. Physiologists assume that this activity consists of chemical activity in the nerve cells. Reaching the muscle this nervous activity sets up what we will designate as (1) the first stage of the speech process, i.e., a chemical activity in the muscle cells and the consequent movement (shortening and thickening) of the muscle. The moving muscle drags with it the bones and other tissues attached to it. Practically all the muscles of the body from the hips upward to the level of the ears are employed in speech. Those of the abdomen and chest control the stream of breath; those of the larynx control the production of musical tones; those of the head and neck control the movements of the jaws, tongue, lips, etc., necessary to the modification of musical tones and the production of consonantal noises.

These movements initiate (2) the second stage, i.e., they set the air particles of the breath into rapid oscillation. These air vibrations, the physical stage of the speech process, are propagated in accordance with the laws of physics in all directions and thus impinge upon the ear drums of the listener. Propagated thence to the inner ear they there act upon appropriate sense organs and through them stimulate the tips of the auditory nerves. The nervous process thus

set up is propagated along the nerve, like fire along a fuse, till it reaches the brain, where it initiates (3) the third stage, i.e., sensations of sound, which awaken in the mind of the listener ideas and emotions similar to but never identical with the ideas and emotions which started this train of processes in the mind of the speaker.

This series of psycho-physical processes may be figuratively called the main trunk line of speech, but the following accessory processes are equally essential. The muscular movements not only produce air vibrations, but also stimulate by pressure of friction sensory nerves located in or upon the muscle fibres, in the synovial membranes of the joints and in the surfaces of the tongue, palate, gums, lips, etc. This stimulation results in (4) kinesthetic sensations (of strain, deep pressure and touch) which report to us the location, nature and extent of the movements executed. Aided by the auditory sensations they provide a means by which we control our movements; through them we learned to repeat desired movements in infancy; through them we become aware of errors of movement (mispronunciations) in later years; without them tradition in language would be impossible.

Not less vital are (5) the many associational processes. The parts of the brain active during thinking are connected (directly or through sub-centres) with the motor areas, and it is a law of mental life that all thought tends to pass over at once into action. There is likewise association between the sounds of the words and their meaning, between the sounds and the kinesthetic sensations, between the kinesthetic sensations and the ideas, between the visual sensations (that is, the appearance of the written or printed words) and the meaning, etc. The effect of these associations is to bind the whole into a co-ordinated and harmonious system, in which each process takes place with a degree of accuracy and order of sequence adequate to the accomplishment of the purposes for which speech is employed.

All the above processes both in man and animals have been developing since primæval times by a natural process of evolution in accordance with the laws of physical and mental growth. On the other hand alphabetic signs or letters are arbitrarily designed or selected by individuals to represent certain sounds. They yield (6) visual sensations. Although originating as symbols of sounds, the letters when grouped into words quickly become associated with the meanings and are primarily symbolic of them.

Thus we see that speech is a combination of three different kinds of symbols: (a) the primary symbols, muscular movements, (b) the secondary symbols, speech sounds, and (c) the tertiary symbols, written or printed words. The average man thinks usually of the last two forms, but he who would understand the nature of language and fathom the laws of its development should rather direct his attention chiefly to the muscular movements and regard language study as applied Psychology of Movement.

The above described processes beginning with thought in the mind of the speaker and ending with the awakening of thought in the mind of the listener do not, however, complete the cycle of speech. It must not be forgotten that speech is a social activity. Man cannot

live without the co-operation of his fellow-men. The chief purpose of speech is to secure this co-operation and thus achieve some form of self-realization, of accomplishing our desires. The communicative process is completed only when the speaker gets a response by word, look, gesture or even silence (for silence is sometimes eloquent), which will enable him to judge the attitude of the listener and hence the degree of his own success or failure.

The problems of General Linguistics fall into two classes: first, those which have to do with the processes of expression and, second, the problems of understanding. Under the first fall the following: the relation of thought to language, the relation of physical to spiritual matters, the origin of language, the degree of accuracy and completeness with which language expresses thought, the extent to which the forms of thought are controlled by language and vice-versa, the effect of environment on speech, the problems of anatomy and physiology of nerve and muscle and of the localization of brain functions, the problems of muscular control. The problems of interpretation include those of understanding and those of sensation. Here fall the questions as to the degree of accuracy with which sensations correspond to stimuli, or, conversely put, how far the state of mind determines the character of the sensation (mishearings, misreadings and misunderstandings), how sensations awaken thought. All these problems may be grouped under two heads: Phonetics and Semantics.

Phonetics.—Phonetics is the general science of speech sounds; *phonology* is the study of the system of sounds of any given language, as, e.g., English phonology. The organs of speech in the narrower sense are the mouth and nose cavities and especially the tongue and larynx; also the trachea and lungs with their controlling muscles. In a broader sense they include those muscles of the abdomen which aid in the control of breathing. The lungs force through the trachea a stream of air, the rate of flow and compression of which are varied from moment to moment to meet the needs of speech. The larynx, which rests on the top ring of the wind pipe, is a small box having a cartilaginous framework overlaid with muscles, connective tissue and mucous membrane. Its most essential parts are the so-called "vocal cords." These are not, strictly speaking, cords at all, but are overhanging, ledge-like projections, one arising from each side of the inner wall of the larynx. The core of each is formed by a small muscle, the front ends are immovably attached to the inner front angle of the thyroid cartilage (Adam's apple) in contact with each other. Each muscle is attached at its posterior end to one of the arytenoid cartilages, which can be moved by means of appropriate muscles upward, downward, forward or sidewise. Thus by the approximation of the arytenoid cartilage: the "cords" can be brought into contact along their entire length, completely closing the glottis, as the opening between them is called; or the rear ends of the cords may be separated, yielding a V-shaped glottis. When brought into contact, or nearly so, and tensed by proper muscular action, they are made to vibrate by the current of air forced through the trachea. The vibrations can be easily felt if the finger be placed upon the Adam's apple during speech

The sound produced is musical tone, consisting physically of a series of like vibrations, and technically called *voice*. The rate per second of the vibration determines the key or musical note on which a sound is pronounced or sung. The shorter the cords and the higher the tension the higher the rate and the higher the note. The loudness is determined by the amplitude of the vibrations of the cords. The air waves produced by the cords are very feeble; but they are reinforced by the resonating effect of the mouth and nose cavity. It is estimated that the voice as heard is some 300 times as loud as it would be if not thus reinforced. The cords, like a violin string, vibrate not only as a whole but also in segments, the segmental vibrations yielding overtones. For example, if the cord as a whole vibrates 100 times per second, the half cord will vibrate 200 times, the third 300 times, the fourth 400 times, the eighth 800 times, the twelfth 1,200 times and so on. The commingling of these overtones of varying loudness is what gives the main characteristic distinction to the voices of different persons.

The *vowels* are "voice" with little or no audible commingling of other sounds. After much study it now seems to be established, that the difference between the various vowels is caused by the presence of certain characteristic tones. Some of these have been recently calculated as follows:

oo in <i>moon</i>	ca.	225 vibrations per second
o in <i>moor, roam</i>	"	460 " " "
aw in <i>maw</i>	"	732 " " "
a in <i>ma</i>	"	1050 " " "

The following vowels have two characteristics:

ee in <i>meet</i>	ca.	310	and ca.	3100
a in <i>mate</i>	"	490	"	2460
e in <i>met</i>	"	690	"	1950
a in <i>mat</i>	"	800	"	1840

A in *ma* has also been found with two characteristics, 950 and 1,240. According to the above definition we must regard the *liquids* and *nasals* *l*, *m*, *n* and *r* as vowels (even though they lack the clear, open quality of *a*, *e*, *i*, *o*, *u*), particularly in such words as *apple*, *serum*, *oven* (often pronounced *ov'm*) and *over*, in which the *e* and *u* are usually silent, the *l*, *m*, *n* and *r* being the loudest sounds in their syllables.

In addition to musical tones the speech organs produce sounds which consist either of irregular vibrations or of regular vibrations, that do not produce on the ear the effect of musical tones. Such sounds are called noises. There are two classes of these noises: (1) Explosive noises, (2) frictional noises.

The former are made by the complete stoppage of the air (effected by a closure at some point in the throat, mouth or larynx), and the subsequent compression of the air behind the closure, followed by the sudden opening of the closure by muscular action and the air pressure. The resulting *consonantal* sound is called a "stop" or "explosive." The closure yielding *p* is made by bringing the lips into contact, *t* by pressing the tongue against the teeth (French and German dental *t*) or the gums (alveolar *t*, as commonly made in England and America, though dental and alveolo-dental *t* is often found among us) or against the top of the mouth (cerebral or prepalatal *t*, as found in Sanscrit), *k* by pressing the rear part of the tongue against the back

part of the hard palate (palatal *k*, as in *kick*) or against the velum (velar *k*, as in *koal* or *coal*) or against the back part of the throat below the velum (guttural *k*, as in Arabic). In all of these sounds except Arabic *k* and the two now to be mentioned, the velum is also drawn upward, closing the nose passage. A *k* may also be made by pressing the epiglottis against the back of the throat and a *glottal stop* is produced by an explosion at the vocal cords (Greek "rough breathing"). A *velar-nasal* stop is made by closing the lips and velum and snapping open the latter. *b*, *d*, *g* are the same explosive noises accompanied by voice. *Trilled r* is produced by a succession of such stops made by the rapid vibration of the tongue or the uvula against the adjacent parts of the mouth. *Frictional* noises (*spirant* consonants or *fricatives*) are produced when the air passage is reduced by near closure to a very small channel and the air forced swiftly through it. Thus are produced voiceless *s* in *see*, *sh* in *shall* and *th* in *think*. To these correspond voiced *z* in *zest*, *z* in *azure* and *th* in *these*. All these are *hisses*. If the channel is larger and the breath driven more gently, the noise is a murmur as in *l* and American northern *r* (voiced or voiceless). Glottal spirants are English *h* (sometimes voiced) and the "whisper."

If immediately following an explosion the passage remains narrow for an instant the explosion is followed by a hiss. These sounds are called *affricates*: *ch* in *change*, *j* in *jump*. *Y* as in *yet* is a swiftly pronounced "long" *e*; *w* in *we* is an evanescent *oo* as in *boot*.

In the production of most of the above sounds the velum may remain open, i.e., drawn forward and downward, adding the resonance cavity of the nose to that of the mouth. This greatly increases the quality (by reinforcing the higher overtones) and volume of the sound. Hence singers are especially trained to use nose resonance to the greatest possible extent. If the velum is closed, fully half the resonance effect is lost. By using more breath and overstraining the muscles of the larynx one can partly make up the loudness, but the quality is irretrievably lost. A full, clear resonance can be secured only when the mouth opening is fairly wide. If it is completely stopped (as in pronouncing *n*), or made very small, we get a muffled *nasal twang* characteristic of certain French vowels and of "Yankee" pronunciation.

The lips may be more or less puckered or "rounded" in the pronunciation of all the vowels and most of the consonants. This gives a peculiar resonance effect. English *o* in *note* and *u* in *tune* are rounded. German *ü* and French *u* are rounded long *e* (as in *meet* or *mere*).

Accent is of two kinds. *Stress* accent is a variation in the energy of utterance (amplitude of vibration) of successive (a) words, (b) syllables, (c) sounds or (d) parts of the same sound; (a) constitutes sentence accent, (b) is word accent, (c) and (d) syllable accent. *Pitch* accent is a variation of musical tone (rate of vibration) similarly affecting sounds, syllables and words. In most, if not all, languages both types occur. In English stress predominates.

Comparatively few speech movements and sounds are here described. Those actually produced are innumerable; they run into the millions or even billions. Each nation has a group of some three score "main" sounds and countless minor variations. Each individual has his own way of speaking; we easily recognize his voice; but even he varies his pronunciation from day to day, nay, even from minute to minute. Here, as everywhere else in animal and even vegetable life, nothing is fixed. As the old Greek philosopher said, *panta rhei*, "everything is in a flux." Movement and change are life; rigidity is death.

Sound Changes.—As already stated, Phonetics is applied psychology of movement. The muscles used in speech, though highly trained, act as other muscles act. You cannot close the eyes and draw with a sharp pointed pencil 10 lines exactly one inch long. A ball player cannot throw the ball twice through exactly the same point over the plate. If he does it is an accident. The best marksman rarely hits the exact centre of the bull's eye. So in speech no one can repeat at will exactly the same movement, much less a group of movements necessary to the production of a given sound. There will always be variations in range, direction, duration and co-ordination. The variations are slight, as are those of an expert marksman, and the consequent variations in sound are either unnoticeable to the "naked" ear or, if noticeable, are really unnoticed, since our attention is wholly absorbed in what a person is saying and we give only the slightest heed to the details of sound. It is only occasionally that variations occur large enough to thrust themselves on our attention. Then we call them mispronunciations.

But the variations, though small and unnoticed, will in a given community under favorable conditions accumulate in a given direction. Thus there will be a slow but steady shift in a given direction, which in time will result in entirely different movements, that is, in entirely different sounds. For example, the word *stone* in Early English was written *stane* and pronounced with the sound of *a* as in *father*; in Chaucer's time the same vowel had the sound of *ou* in *bought* and the spelling was reformed to *stone*. Since then it has shifted to the present pronunciation. The following types of changes occur: (1) Cessation of movement. Sounds become silent, as most *e*'s, at the end of English words, *gh* in *high*, *b* in *lamb*, etc. This change may be facilitated by a stress accent on the preceding syllable. (2) Increase or decrease in the duration of the movement. Example: The Indo-European extra long diphthongs *ai*, *ei*, *oi*, etc., became the ordinary length diphthongs *ai*, *ei*, *oi*, etc., in Latin. (3) Variation in extent of movement. This variation affects, for example, the shape of the mouth cavity and the tension of the vocal cords, giving rise to variation in vowel quality, as in *stone*, cited above, and characterizing such shifts as that of Indo-European palatal *k* to fricatives in Sanscrit and Slavic. (4) Anticipation or delay of individual movements composing a group. Such are the voicing of previously voiceless consonants and vice-versa; assimilation both progressive and regressive; and *Umlaut*. (5) Change in the order of movements. This is

a fertile source of mispronunciation, but appears to have caused few historical changes.

The causes of these changes are partly physiological and partly psychological, being due to changing chemical conditions in the muscle or to changes in state of mind. Widespread regularity observed in these changes has given rise to the belief that, like other natural phenomena, they follow regular laws; but the conditions determining the changes are extremely complex and difficult to control. Such laws are Grimm's law of consonant change, with its modifications by Verner and Burgmann. See also PHONETICS.

Semantics, or Semasiology; the Science of Meaning.—The simplest word has six "personalities," so to speak; it is an intricate Dr. Jekyll and Mr. Hyde. It has three material forms: the moving muscle, the vibrating air and the written or printed signs. To each of these corresponds a purely mental side: the word picture, as seen "in the mind's eye"; the memory image of the sound and the kinaesthetic or "motor" image; that is, the feeling of touch, strain, etc., in the muscles. These are mental states, mental "contents." The picture of a word is the same sort of thing as the picture of a house. Both are made up of ideas of color, shape and direction. We saw above that these are linked to one another by associations, that they are also linked up with the motor areas. We now add that they are linked up with all other mental contents that constitute thought, so that when these last are in consciousness the word images also appear. It is a law of psychology that any mental content may thus be linked up with, that is, suggest, recall or represent any other mental content. But all ideas are mental contents and all word images are ideas or mental contents. Meaning is simply one mental content which some other mental content by association calls up, that is, represents. When we hear or see words, their mental images simply through association call into consciousness other mental contents, which are their meaning. Meaning is representation.

Two kinds of mental content enter into all thought: sensation and feeling. The first is the mental state resulting immediately from the stimulus of one of the sense organs. Examples are: red, bitterness, cold, hardness, fragrance, pain, etc. We locate them (except headache) outside of the brain. Combinations of these sensations constitute ideas. No idea ever enters consciousness without awakening a personal response, such as that of pleasure, displeasure, relaxation, strain (as in anxiety), stimulation or inhibition. This reaction is called feeling. Combinations of these feelings constitute emotions and passions. The will is one form of them. On the basis of ideas and feelings abstract ideas develop.

In ideas, as in muscular movement, there is continual variation. The details of form, direction, color, intensity, are continually changing. We never obtain a wholly new idea; it is always a variation or modification of the old. The variations are greatest in childhood; in manhood the ideas become more stable; in old age they approach a condition of rigidity as we draw near to death. Changes in ideas consist in the loss of former elements from them and the addition of new ones.

Of the elements of an idea some are relatively permanent, recurring time after time with the recurring idea, as, for example, the general shape of a horse. Others a temporary, as the color, actions or temper of the horse. A detail may be present once and then disappear forever. Permanency is often, as in the case just mentioned, based on qualities of objects in nature, but often it is not. Again, not all the elements are equally prominent in our consciousness. Some come out clearly, others fade into the background. Now it is the color of the bird on which we fix attention, now his song, now he is for us merely a symbol of the coming of spring.

In the meanings of words, as in muscular movement, the small variations accumulate with time so that a word may eventually have totally changed its meaning. We are not usually aware of these changes any more than we are aware of the sound changes, because our attention is wholly occupied with the present idea and we seldom recall its older form for comparison. But when we read old books, these changes force themselves upon the attention. Comparing old and new meanings, we find that concrete words have become abstract and vice-versa, *comprehend* meant at once time "seize," and we now use *catch, take, get, tumble* in the sense of "understand," that words have suffered restriction or expansion of meaning (a *minister* was originally any servant, now it is a servant of God, or of the state; *gain* originally had the narrower meaning "harvest"), that they have shifted to a higher or to a lower moral value (German *selig* "blessed" is English *silly*; Latin *mens* means "mind," but *mentiri* means "to lie," i.e., falsify). There have also been distinguished (a) changes of non-dominating elements, (b) of dominating elements, (c) of permanent elements, (d) of transitory elements, (e) from ideational content to emotional content and the reverse, (f) in degree of emotional value, (g) ideas corresponding to one sense organ to those corresponding to another, as when we say "a sharp knife, a sharp tone, a sharp taste, a sharp man" (the last usage being abstract). See SEMANTICS.

Grammatical Categories.—An especially important branch of semantics is that dealing with the parts of speech and other grammatical categories, the case relationships, mood, tense, voice, number, degree, etc., all of which are the product of the analyzing and classifying processes of the mind. The normal mind quickly develops the power of distinguishing various qualities, such as sex, and their degrees, and of observing relationships of time (present, past, future, before, after, simultaneous), place (in, on, about), cause, effect and so on. Other categories reflect the attitude of mind: purpose, will, desire, probability, doubt, necessity. They run into the thousands. Finnish has 18 cases. One language has over 60. Some of these occur very frequently and are very important dominating elements of thought. Their frequent occurrence, importance and the degree of readiness and closeness with which they fuse with other concepts, are such that the sounds or words representing them act both phonetically and semasiologically in peculiar ways. They find expression in the following forms: (1) Juxtaposition, e.g., *apple tree, tree toad*. Juxtaposition is but the first

stage of composition, as seen in *therefore, Johnson*; (2) Relative rapidity of utterance of different sounds or groups of sound, including pauses. (3) Stress of voice, signifying, for example, relative importance; (4) Pitch of voice, indicating interrogation, irony, etc.; (5) order, e.g., *apple-pie, pie-apple*; (6) adverbs; (7) prepositions; (8) conjunctions (including (9) pronouns); (10) auxiliary verbs; (11) inflectional forms: suffixes, prefixes, infixes and various modifications of sound, such as umlaut (mutation) and vowel gradation; (12) often no special formal sign is needed, as when the relationship in which objects stand to each other in nature is so impressed upon us that the mere mention of the objects suggests it. Dickens' character Jingle depended much upon this fact. (13) Lastly the general circumstances and conditions of a conversation and the known purpose of the speaker are valuable keys to the meaning.

The associative processes and sound changes combine to give origin to inflectional endings. Some are known to have originated in composition; in other cases sounds developing in accordance with purely phonetic laws independent of meaning have later taken on the significance of inflectional elements. Adverbs and conjunctions are commonly developed out of inflectional forms of other parts of speech, especially nouns, adjectives and pronouns, though less commonly from verbs. The preposition is only an adverb "in disguise."

Classification of Languages.—There are a number of principles on which languages may be classified. That most widely known was elaborated by von Humboldt. He distinguished between the outer and inner sides of languages, between the movements and the conceptual forms. He conceived that the latter, being inherent in the human mind, are the same for all nations, but that different peoples expressed them with different degrees of perfection. He considered the most primitive type to be the "isolating" languages, in which the words are all simple roots with nothing resembling inflectional forms. Higher were the "agglutinating" languages which show a partial fusion of roots into loosely united word elements, and highest the inflected type. This principle cannot be applied practically to the classification of the languages of the earth, because few, if any, of them belong exclusively to any one class. As a matter of fact, both the analytic tendency (toward isolation) and the synthetic (toward inflection) are present in all languages at all times. Now one may prevail, now the other, as in Old English there were elaborate inflections, while at present English belongs rather to the isolating type, as does the Chinese. In fact languages show such complexity and variety that it may be doubted whether any principle of classification can be consistently applied to them. The best that can at present be done is to put into groups by themselves certain languages which have conspicuous resemblances in vocabulary and external form. Such clearly defined groups are: The Malayo-Polynesian Group (agglutinative), including Malayan, Melanesian and Polynesian; Bantu or Kafir; Dravidian Group in southern India and Ceylon; Finno-Ugric, comprising Finnic (six languages), Permian, Volga Finnic and Ugrian, the chief language of which

is Magyar; Chinese, an isolating language, as are also the unrelated Anamese, Siamese, Burmese and Tibetan; Turko-Tataric.

There are about 30 groups of languages recognized on the American continent but their relationships are not all perfectly understood. The Semitic branch includes, among others, the Assyrian (with Babylonian), Hebrew, the language of the Old Testament, Phœnician and Arabic (classical and modern). To the Hamitic branch belong Ancient Egyptian, Coptic, Berber and several languages in Abyssinia and adjacent territory. The Indo-European family will be discussed in detail in the next section of this article.

B. COMPARATIVE PHILOLOGY.

In this article only Indo-European Comparative Philology is treated. The Indo-European family of languages contains the following branches:

1. Aryan or Indo-Iranian group. This comprises (a) the Indian languages, that is, literary Sanscrit (both Vedic and Classical) with a very rich religious and secular literature; Pracrit, the ancient vernaculars, from which many of the spoken languages of modern India are descended; Pali, the language in which the Buddhistic writings are largely preserved. Modern Gipsy also belongs here. (b) The Persian group, that is, Avestan (the language of the Zend Avesta); Old Persian (the language of the cuneiform inscriptions); Middle Persian or Pehlevi (till about 700 A.D.); Modern Persian, Kurdic, Ossetian and Baluchi; Parsi, the language of the Fire Worshipers.

2. Armenian, old and modern.

3. Greek, with its many dialects and marvelous literature. The chief ancient dialects were Attic-Ionic, Doric and Æolic; the main historical periods are Homeric, Classical Attic, Hellenistic, Byzantine, Modern.

4. The Illyrian group, represented by the Albanian.

5. Italic group, comprising Latin and the Oscan-Umbrian dialects. From spoken Latin disseminated throughout the Roman Empire the Romance languages have developed.

6. Celtic, including the language of the ancient Gauls, and modern Welsh, Cornish, Scotch and Irish, the last with an important literature.

7. Germanic or Teutonic, represented by (a) old Gothic; (b) Scandinavian (Danish, Swedish, Norwegian and Icelandic); (c) West Germanic with its various older dialects from which modern German, Dutch, Flemish and English are sprung.

8. Balto-Slavic includes (a) Lithuanian, Lettish and Old Prussian (now extinct); (b) East-Southern Slavic (Russian, Bulgarian, Serbian, Croatian, Slovenian); Western Slavic (Czechish, Bohemian, Wendish, Polish and Polabian).

It is known that all of these had their origin in dialects of one common language, the home of which on linguistic and archæological evidence is generally conjectured to have been between the Baltic and the Caspian seas. Thence they spread by migrations to their later habitats. By the separation thus brought about and in some cases at least by race mixture the differences between the dialects increased until they became distinct languages, which in their

turn spread over larger areas, and broke up again into dialects. These later dialects developed into still other languages, and so on indefinitely. This process is still going on, though more slowly, because of the closer communications existing between nations. It is possible, perhaps even likely, that the Celtic and Italic groups arose from one common dialect, just as did Baltic and Slavic or Indian and Iranian; in which case we should have to speak of an Italo-Celtic group instead of two separate groups. Each of these Indo-European groups developed separately, no one of them springing from another. Thus English is just as closely related by origin to Hindi or Bengali or Russian or Czechish as it is to Irish or French, although the extensive borrowing of French words in modern times gives the English vocabulary a closer resemblance to the French.

The reconstruction of the primitive dialects is accomplished (only, of course, to a very slight degree) by discovering through comparison of the related languages what were the original sounds, words, forms and meanings. It must be understood, however, that it is impossible to reconstruct combinations of words. For, while we may reconstruct two different words, we cannot be certain that both were used in the given form in a given dialect at the same time. Furthermore all reconstructions are only approximate. But philologists are not distressed on this account, since they are interested not in discovering the starting points of modern forms (which, after all, were only end points as compared with the innumerable forms that for ages preceded them), but in discovering the nature of the changes that took place and the laws by which they were governed.

We know that the early dialects possessed roughly the same group of sounds as is described in the earlier part of this article. It doubtless possessed at one time a strong stress accent which appears to have brought about such variations in vowel sound as are seen in Greek *tithēmi*, *thētos*, *tethmos*, which show the vowel *e* as long, short and vanished. It also seems that at least in the eastern area this accent was combined with a marked musical or pitch accent. Compound words were freely formed. There was extensive use made of suffixes and prefixes in derivation. There was very elaborate inflection: three genders (not referring, however, mainly to sex); three numbers (singular, plural and dual); eight case forms were differentiated in the singular, six in the plural and four in the dual; the verb had forms distinguishing actions as beginning, ending, progressing, completed or momentary, but gave less accurate expression to the time; it had also desideratives, intensives, causatives and iteratives; the verb had also three persons, three numbers, five moods, two voices, active and middle, but apparently no special passive form; there were also various verbal nouns and verbal adjectives. The noun and verb show some striking resemblances in form, which suggest that at a much earlier period they, like the English noun and verb (cf. the word *stone* used both as a noun and a verb) were only slightly differentiated or not at all.

For the *Origin of Language*, see *SPEECH*, GENESIS OF

C. HISTORY OF LANGUAGE STUDY IN EUROPE.

The scientific study of language in Europe began with the Greeks, who, however, were not interested in language for its own sake so much as for the light its study threw on other fields of knowledge. Plato investigated etymology because he hoped thereby to learn something of the nature of material things. Aristotle, who studied language as an accessory to logic and dialectics, investigated especially the relations between thought and the forms of words. His main contribution was the definition of some of the parts of speech and some of the categories of the noun and the verb. He is justly regarded as the founder of systematic grammar. The Stoic philosophers extended and supplemented his definitions till they covered practically the whole field of grammar. Unfortunately the domination of their thought by logical theory led them into some errors. The work of the Greeks was summed up in two grammars (that of Dionysius Thrax in the 1st century B.C. dealing with sounds and inflections, and that of Apollonius Dyscolus in the 2d century A.D. dealing with syntax), which have served as models for the thousands of systematic grammars since composed in Europe. The Roman grammarians added practically nothing to the achievements of the Greeks, contenting themselves with translating their words into Latin and adapting them to the Latin language. (See DONATUS; PRIGIAN). The Scholastic philosophers (from the 12th century on) did positive harm by completely subjecting grammar to logical theory. Grammar became practically "applied logic" (see NONIUS). The last representative of this school was the German Gottfried Hermann (1772-1848), who, however, endeavored to combine the older ideas with the Kantian categories. Some slight influence was exerted in Europe by Arabic grammarians by way of Spain. In addition the Hebraist Reuchlin (1455-1522) introduced the idea of "roots," that has played so important a part during the last 150 years.

A new era in language study begins with the development of the "historical-philosophical" school in the earlier part of the last century. The change was determined chiefly by the growth of Romanticism and the "discovery" of Sanscrit. Language study was more completely liberated from the domination of logic and speech came to be thought of rather as an historical development than as a static structure. The wonderful enthusiasm for language study then prevalent was stimulated by such works as Schlegel's 'Sprache und Weisheit der Inder' and von Humboldt's 'Kawi Sprache.' Franz Bopp (1791-1867), starting out to investigate the nature of verbal endings, published a series of works which laid the foundations of Comparative Philology. Sir Wm. Jones had recognized Greek, Latin, Sanscrit and possibly Gothic and Celtic as related languages. Bopp added Zend (in 1816), Lithuanian and Old Bulgarian (1833-35) and Albanian (1855). He laid the foundations for the later work of Pott (in etymology), Fick (lexicography), Schleicher (critical phonology) and Schrader (prehistoric antiquities of the Aryan people). The books of Max Müller, professor in England, and William D. Whitney,

American, have popularized the whole subject, which is summarized in Brugmann and Delbrück's 'Principles of Comparative Philology of the Indo-European Languages' (7 vols., in German). Grimm's 'German Grammar' (Vol. I, 1819) is the first great embodiment of the historical point of view. He directed his attention mainly to the changes continually occurring in the living spoken dialects of Germany (instead of studying older literary remains) and on the basis of a previously unparalleled collection of data, he deduced the famous statement of Indo-European consonant changes known as Grimm's law. This and the similar work of other later scholars combined with the invention of instruments for the exact measurement of muscular movements and air waves has led to the development of the important field of *Experimental Phonetics*. Most important of all, however, is the fact that in language study the laws of psychology have replaced the laws of logic as the basis of the methods employed in all investigations. As a result of this, language study has taken its place beside jurisprudence, history, economics, etc., as one of the Humanistic or Psychological Sciences.

CLARENCE L. MEADER,

Professor of Latin, Sanscrit and General Linguistics, University of Michigan.

LANGUAGES OF THE WORLD. Languages can be classified in two ways: genetically or typologically.

Genetic Classification.—According to this grouping, languages of an entirely different type or structure, such as English, Sanskrit, Russian, are grouped together because they have a common origin—in fact, English and Sanskrit and Russian all ascend to a common ancestor, Indo-European (q.v.), a language spoken probably in Europe about 4,000 years ago. Although these three languages have deviated enormously from that ancient ancestor and today their respective speakers cannot understand each other, still the fact that they have evolved from one and the same language allows us to classify them genetically together and to call them all Indo-European, as belonging to the Indo-European language family.

The genetic classification of languages, in its pure form, originated essentially with the German linguist, August Schleicher (1821–1868), who presented it first in his *Compendium der vergleichenden Grammatik der indo-germanischen Sprachen* (1861–1862). Schleicher compared every language to a stem, which, growing, branches out into two or more different languages, each in turn producing new branches, and so on *ad infinitum*. This theory is called in German the *Stammbaumtheorie*, or stem-theory, or also (in English) family-tree-theory. Thus, for example, adapting it with some modernization to this case, the original Indo-European language once “branched out” into Southern and Northern Indo-European; the former further divided into Celtic, Italic, Hellenic, Indic, and Iranian; the Northern into Germanic, Baltic, and Slavic; Germanic subdivided into Western, Northern (Scandinavian), Eastern Germanic; Western Germanic (taking only one example) further divided into High German and Low German, while from Low German came Dutch, Flemish, Frisian, English; and English itself has developed different dialects, such as Scottish-English, American-English, Australian-English.

Typological Classification.—This arrangement began with the brothers Friedrich and A. Wilhelm Schlegel in their respective books *Von der Sprache und Weisheit der Indier* (1808) and *Observations sur la langue et la littérature provençales* (1818). They classified languages according to their structure (that is, their way of expressing grammatical relations) into three classes: isolating, agglutinative, inflectional. Despite many recent criticisms and with some reservations, this classification still can be defended.

Isolating Languages.—These languages express themselves by means of concrete and inalterable words or roots, without any purely grammatical tools, such as articles, prepositions, conjunctions, endings, or interior mutations. There is therefore no distinction between parts of speech, such as nouns, verbs, adverbs, since such a distinction is of course essentially functional or grammatical. Roughly, if English were formed only of sentences like “I drink good wine,” “three-month baby,” “We love fish,” “Drive slow,” “Cut that tree,” “We will leave America,” it would be an isolating language, or very near to this type, for all the words composing these sentences have an existence of their own and even can be used in isolation: *drink! three! baby! fish! slow! cut! America!* Their syntactical relation is indicated exclusively by their respective position, not by any special particle (such as *to*,

with, if) nor by endings (such as *he loves, trees, he left*) nor by interior change (such as *give, gave; sing, sang, sung, song; mouse, mice*). Moreover, most, if not all, of these words can be used both as nouns and verbs (*will, fish, cut, baby, wine, leave, tree, love, drink*) and as adjectives, adverbs, and verbs (*slow*, at least in colloquial American).

Agglutinative Languages.—These languages, on the other hand, express the grammatical relations which mold the structure of the sentence from the clay of words through recognizable but separable elements, either prefixed (prefixes) or suffixed (suffixes) or infixes (infixes), which have no existence at all in isolation (such as English *the, to, with, if, when*). Thus sentences like English “I go hunting with my brother,” “If you love the sea,” “Why do you not go to Florida?” can be taken as examples of an agglutinative language, for words like *with, my, the, if, to* never occur isolatedly and indeed have no meaning at all outside a sentence.

Inflectional Languages.—These languages inflect, that is, modify internally a word, thereby indicating a different function (*see, saw; man, men; mouse, mice*). In a wider sense, languages possessing endings (such as English *I love, he loves; boy, boys; ox, oxen*) are also called inflectional, although the procedure is quite different and indeed very near to the agglutinative (*to me* and *ox-en* is almost the same type). The distinction can be drawn in a case like Latin nominative *lupus*, genitive *lupi*, dative *lupo*, for here we cannot detach the stem from the ending, as can be done in the case of *ox, oxen*. That is, in this case the degree of fusion between the concrete element (the stem) and the grammatical characterization (ending) is the sole feature which enables us to distinguish an inflectional from an agglutinative language.

Typological Problems.—It becomes obvious here, as in many other cases, that the difference among the three types of languages (isolating, agglutinative, inflectional) is relative and that many intermediary degrees exist. Very few languages can be defined as purely isolating or agglutinative or inflectional; we can say only that the one or the other type predominates. This can be seen clearly in English, a language which belongs to a certain extent and from certain aspects to all three types, although the agglutinative may be said, on the whole, to be prevalent.

According to August F. Pott's fine definition in *Jahrbücher der freien deutschen Akademie* (Frankfurt am Main, 1849), in the isolating languages the matter or concrete semantic content (word, root) and the form or grammatical function are completely independent from each other; in the agglutinative languages matter and form are loosely connected, by the simply exterior method of juxtaposition, and can be separated mentally; in the inflectional languages (*men, saw, mice*) matter and form are inseparably fused and the one cannot be expressed without the other. In a language like Latin, every noun must be singular or plural, nominative or genitive, every verb must be in a certain person, tense, mood, and so forth.

If we classify all languages of the world according to this system, we find that, with the above reservations, isolating languages are very rare and are found only in a section of Asia, which includes China, Indochina, and Tibet. All these languages are related also genetically to

each other and possess tones. Purely inflectional languages are also exceptional and likewise are found only in a continuous section of Eurasia, from India to Iceland; they all belong to two families: the Indo-European and the Semitic. All the other languages of the world, including all the native languages of Africa, Oceania, and America, plus Basque and several Ugro-Finnic languages in Europe, are, at least in a broad sense, agglutinative. An enumeration of all the agglutinative languages of the world would be much too long. It will suffice to mention here all those in the Uralic and Altaic, Dravidian, and Bantu families; Ainu, Japanese, Korean, Ryukyu; all the Caucasian languages (among them Georgian, Circassian, Lezghian); Basque, Sudanese, Hottentot, Bushman, Negrito, Andamanese, Papuan, Australian, Tasmanian, Eskimo; and all the native American languages. Some of them, however, such as Japanese and Finnish, are very near to the inflectional type and even could be called inflectional in a broad sense of the word. On the other hand, Eve or Ewe (on the Guinea coast) is predominantly isolating.

It should be stressed that these two types of classification are independent of each other and that of three languages belonging to the same family, and even closely related, one can very well be isolating, one agglutinative, one inflectional. Thus, in the Indo-European group Russian and Lithuanian are essentially inflectional, French is agglutinative, while English and modern Persian show strong isolating characteristics.

It was held widely during the 19th century that originally all languages were isolating (that is, had only concrete monosyllabic words or "roots"); then, by subordinating some roots to others and lowering them to the status of grammatical tools, they reached the agglutinative stage; finally, by fusing the elements into words, they arrived at the inflectional stage. This theory is now abandoned; however, the fact should be retained that a language can pass from one stage to another. Chinese is now isolating, but was certainly not so once (see Otto Jespersen, *Language*, pp. 370 ff.), and English, French, Persian were once heavily inflectional.

Linguistic Interpretation.—The problem is therefore very complex. But the question of the genetic relation also by no means is easy. An Italian scholar said once most aptly that the problem of the relation of languages, which seemed so easy in Schleicher's time, has now become a torment. Through the works of Johannes Schmidt, H. Schuchardt, G. I. Ascoli, J. Gilliéron, and Roman Jakobson, and especially through the efforts of the Italian neolinguists, of whom M. G. Bartoli is the major representative, a new conception of linguistic relation was developed. According to Schleicher's Darwinian conception of language (the stem-theory) a language belonged once and forever to its original group, up to its "death," just as a branch belongs to its tree until it withers. Languages were organisms, living beings, like trees or animals; they were born, lived, and died. Therefore modern English, being descended from Old English, is and must forever remain a Germanic language, just as French or Rumanian, being descended from Latin, are and must forever remain Latin or Romance languages, at least in their essential parts (these being phonetics and morphology, as opposed to vocabulary, which can absorb foreign elements). It is obvious that this

conception, so formulated, is completely anti-historical, inasmuch as it separates language from the men who speak it and makes it an independent entity, over which man has no power, but which evolves inevitably, like an animal or a plant, according to its own interior and mysterious laws.

The neolinguistic conception, on the other hand, on the basis of the study of living dialects, denies the existence of "pure" languages or dialects. The history of language, just as the history of mankind, is a history of perpetual interpenetration, fusion, and transformation, due to historical, human causes. It is nothing but the history of the people who speak it. A definition of English as Germanic is incomplete, just as a definition of French or Rumanian as Latin or Romance; the first one ignores that most of the English vocabulary is Latin or French, just as most of the Rumanian vocabulary is Slavic. But a language does not only change its vocabulary under the impact of a foreign language; it changes also its phonetics, morphology, syntax, and its whole structure.

There is no limit whatever to linguistic interpenetration. If the Anglo-Norman conquest of England had been a little more thorough, if the conquerors had been a little more numerous or more determined to keep their language and impose it on the lower classes, English would now be a Romance language like French, perhaps with a strong residue of Germanic element. The Roman conquest of Gaul was more lasting and thorough than the conquest of, for example, Albania or of the Basque region, and therefore the Celts of France were more thoroughly Romanized than the English were Frenchified; that is why we call French a Romance language, despite its strong Celtic remainders in pronunciation, whereas we do not usually call Albanian a Romance language, despite the enormous influence which Latin (and later Italian) has exerted over it. A language, therefore can shift from one family to another; and in fact this frequently happens, for the language of Gaul belonged once to the Celtic family and it now belongs to the Latin family. Sometimes scholars are in doubt about the classification of some "mixed" languages; but in reality all languages of the world—at least all languages of which the history is well known—are "mixed" or "pidgin."

But this linguistic interpenetration is by no means limited to the vocabulary; it invades without exception every section of language—phonetics, morphology, and syntax. The sound *i* (or *journey, gentle*) and the initial *v* (*value, vintage*) were introduced into English by the French-speaking Anglo-Normans; they, however, can hardly be considered now as "foreign" sounds; English would not be English without them. Likewise, at least one sound of Armenian is of Iranian origin; Armenian would not contain it if it had not come into contact with Iranian. In German, expressions like *der hund, ein hund ich habe gesehen, ich werde sehen, er ist gesehen worden* look phonetically good German; in reality they are nothing but slavish reproductions or "loan-translations" of such French (or rather Gallo-Roman) types as *le chien, un chien, j'ai vu, je verrai, j'ai été vu* (and the same is true of course of the English equivalents *the dog, a dog, I have seen, I will see, I was seen*). They are, as Bartoli most aptly puts it, creations of Germanic matter and Latin spirit; primitive Ger-

manic did not have them and probably never would have produced them, unless it had come into contact with Latin, or rather late Gallo-Latin or Gallo-Roman. It must be added that Latin itself received these constructions from Greek, the ultimate source for these morphological innovations which have invaded all of western and most of northern Europe.

Another important consideration must always be kept in mind. While the relation (or some sort of relation or connection) between two languages can be demonstrated within the above-mentioned limitations, the negative proof never can be given. We never can assert that two languages are not related, and when a scholar does so, he simply oversimplifies and uses a loose and colloquial expression, which has no real scholarly value. Before the discoveries of Filippo Sasseti, Bonaventura Vulcanius, Gaston L. Coeurdoux, Sir William Jones, L. R. Rask, F. Bopp, and others, it was believed that English, Italian, and Hindustani—to take three examples at random—were not related; we now know that they are, that they all belong to the Indo-European family. It is quite possible that some day, through further and deeper studies or through the discovery of new documents, the relation between English (that is, Indo-European) and Semitic, Bantu, or Chinese may be demonstrated; all we can say today is that such a relation has not been proved, or at least not proved to the satisfaction of the majority of the most serious and competent scholars.

Number of Languages.—The question of how many languages are spoken on the globe also is not easy to answer. First we should define exactly what we mean by language. There is no absolute definition of what a language is. The distinction between language and dialect is a moot one. Is Milanese a language or a dialect? How about Slovenian, Provençal, Sardinian, Flemish, Schwyzerdütsch, Portuguese, Catalan, Ladin, White Russian, Slovak, Croatian, Ukrainian? Such a definition is frequently troubled by nationalistic, political, and religious opinions, which are not based strictly on linguistic facts.

The word "language" is frequently used in the sense of literary, standard, or official language of a state, employed in schools, courts, newspapers, stamps, coins, or books, and having a recognized national and international status. If we limit the definition of language to such cases, the languages of the world are perhaps less than 100. There are few more than 50 independent states in the world; and although in the Soviet Union (a federal republic) a certain number of languages (two or three dozen) are officially or semiofficially recognized, Spain and 20 American republics use only Spanish as an official language, while the United States, Great Britain, and the British Dominions use only English. Switzerland also adds no language to the international community, since Ladin has only a semiofficial and rather symbolic value.

Definition of Language.—A definition of language which can be used with profit is based on the possibility of reciprocal understanding. Two persons who understand each other speak the same language; two persons who do not understand each other speak two different languages. Even this definition, however, has its drawbacks; it is difficult to define with any exactitude whether two persons understand each other or not, and to what extent, and on what subjects; many elements

are involved. If, however, we accept this definition and apply it with certain common sense, we reach a total of about 2,800 languages (the French Academy recognizes 2,796). According to such a conception, of course, Chinese—as a spoken language—does not exist, since all Chinese do not understand each other; we must admit in China several "Chinese" languages (at least three or four).

Always following the last definition, we observe that perhaps 2,000 of these 3,000 languages are spoken by a few thousand or even a few hundred persons, or less; such is the case for many American Indian, African, Siberian, and Polynesian languages, used only by a few savages. On the other hand, a few great civilized languages account for about one half of the earth's 2,378,000,000 inhabitants; the "national tongue" of China is understood by perhaps 300 million persons; English by about 250; Hindustani by 160; Russian by about 140; Spanish by 110; then come German, Japanese, French, Italian, Malay, Bengali, Portuguese, and Arabic. The last century has seen a vast augmentation and spread of a few great cultural languages, especially European, and the destruction or assimilation of hundreds or thousands of small languages and dialects. This is the effect of the great world changes which are called industrialization, colonization, and imperialism.

Geographic Extension.—If we look at the geographic extension of the language families, we find a very similar picture. Almost all of Europe and Asia is occupied by five families: the Indo-European, extending from Calcutta to Iceland; the Semitic, occupying all the Arabic states; the Indo-Chinese, covering China, Tibet, and Indochina; the Uralic and the Altaic. Japanese occupies a small, although densely populated, area. The greater area of Africa is also occupied by three or four great language families.

Europe is now covered almost entirely by Indo-European languages. The only exceptions are: Basque, spoken in contiguous zones of France and Spain; Lappish in Northern Scandinavia; Hungarian, a Ugro-Finnic language introduced by invaders in the 10th century; Finnish; Estonian; and a few Ugro-Finnic and Turkic languages in Russia. The Indo-European languages of modern Europe are divided into the following families (clockwise from east to west): Slavic, Baltic, Germanic, Celtic, Romance, Albanian, Greek. These are also unequally distributed as far as the number of speakers is concerned. Greek has about 8 million speakers, Albanian little more than 1, Baltic about 4, Celtic perhaps 3, mostly bilingual. Most of Europe, therefore, is divided among three major groups: Romance, Germanic, Slavic. Slavic accounts for about 200 million speakers, Germanic for somewhat less than that number, Romance for about 150 million. But here again we must beware of false analogies. While the Slavic languages are very close to each other, so that their speakers can understand each other to a great extent, this is not quite true of Romance (especially for French) and even less for the Germanic group, which shows very little unity.

The problem is further complicated by the phenomena of bilingualism, trilingualism, and so forth, which is rare in North America, but frequent in Europe, and even more so in certain regions of Asia.

Language Families.—Here is a list, with

some added comments, of the main language families of the world according to the authoritative work of Antoine Meillet and Marcel Cohen (Paris 1924): (1) Indo-European; (2) Hamito-Semitic (a unity generally, although not universally, accepted); (3) Ugro-Finnic and Samoyede (called Uralic as a unity); (4) Turkic (including Turkish, Mongol, Tunguz); (5) Japanese; (6) Korean; (7) Ainu; (8) Hyperborean (or Palaeo-Asiatic); (9) Ancient Anatolian languages (Khatti is certainly not Indo-European); (10) Basque; (11) Northern Caucasian; (12) Southern Caucasian (perhaps to be united with Northern Caucasian); (13) Dravidian (in central and southern India); (14) Sino-Tibetan; (15) Austro-Asiatic; (16) Malayo-Polynesian; (17) Australian; (18) Sudanese and languages of Guinea; (19) Bantu; (20) Bushman and Hottentot; (21) American Indian languages.

To these should be added at least Sumerian, Urartean-Hurrian, Eskimo, Aleutian, Burushaski (spoken around the Hindu Kush). The unity of all the American Indian languages has been asserted, but certainly not proved (68 families are now generally admitted); and the unity of Australian is also very doubtful (at least 6 different families seem to appear). Some scholars also admit Lati and Andamanese as independent families. Of the ancient tongues of Europe, Etruscan (now extinct) has no certain genetic connection with any other language, living or dead.

On the other hand, a remote genetic relationship between Uralic (Finno-Ugric plus Samoyede) and Altaic or Turkic is admitted by most scholars, although it cannot as yet be considered as a fact.

It must always be kept in mind that in all genetic classifications some classes, such as "American Indian" languages, have a pure geographical, not really linguistic, character.

GIULIANO BONFANTE,
Princeton University.

LANGUEDOC, lǎng-dōk' (Fr. lǎng-dōk', former province), France, varying very considerably in extent, its unity being entirely a political creation, but including the present departments of Aude, Tarn, Hérault, Lozère, Ardèche and Gard, as well as the arrondissements of Toulouse and Villefranche, in the department of Haute-Garonne; and the arrondissements of Puy and Yssingeaux, in the department of Haute-Loire. Toulouse was its capital.

LANGUR, lün-gōōr', a monkey of the genus *Semnopithecus*, containing large leaf-eating species of the Himalaya Mountains, India, southward into Ceylon, southwestern China and the Malayan region eastward as far as Java. The genus represents an interesting transition-group between the gibbons and the catarrhine monkeys, and includes a large assemblage of species with a long, thin body, tall hind-legs, long, slender tail and no cheek-pouches, such as the entellus, or sacred monkey of the Hindus, the wanderers of Ceylon and several locally conspicuous kinds. These monkeys dwell chiefly in forests and go in troops of considerable size. They feed on leaves and fruit, often doing much damage in native plantations. They rarely descend to the ground, and when disturbed there seek to escape by prodigious bounds; but ordinarily they remain in the treetops, and progress by swinging from branch to branch, often at surprising speed.

LANIARD, or **LANYARD**, lǎn'yērd, a small rope, usually a four-stranded hemp rope, used on a ship. It is employed in setting up rigging, being rove through dead eyes, and in making fast heavier ropes or other objects. The article to which the rope is attached gives it the names bucket-laniard, lock-laniard (for firing the percussion hook of a cannon), etc. A knifelaniard is the broad white tape for carrying a knife around a sailor's neck and is a part of the regulation uniform in the United States Navy.

LANIER, lǎ'nyēr, or **LANIERE**, Nicholas, English musician: b. London, 1588; d. there, February 1666. He came of a family of French musicians who had served for generations in the English royal household. He became a musician in the royal household about 1604 and subsequently was master of the king's music under both Charles I and James I. He followed the royal family into exile and after the Restoration resumed his former post of master of music. He composed the music for Ben Jonson's masques *Lovers Made Men* and *The Vision of Delight*, introducing the Italian *stilo recitativo* into England. Much of his music remains in manuscript. He was also a painter and a connoisseur of art.

LANIER, lǎ-nēr', Sidney, American poet: b. Macon, Ga., Feb. 3, 1842; d. Lynn, N. C., Sept. 7, 1881. His father, Robert Lanier, a lawyer of Macon, came from a family noted for a love of music and art. An ancestor, Jerome Lanier, a Huguenot refugee, was well known at the court of Queen Elizabeth as a musical composer; another forebear, Nicholas Lanier, was director of music at the court of James I and Charles I, and first marshal of the Society of Musicians incorporated at the Restoration. Sidney Lanier's mother, Mary Anderson, belonged to a prominent Virginia family also noted for decided talent for music and poetry. The poet's artistic temperament was therefore a direct inheritance. As a child Lanier was passionately fond of music and without any instruction learned to play on the guitar, piano, flute and violin. A critic said of him in later years: "In his hands the flute was transformed into a voice that set heavenly harmonies into vibration." This passion for music also showed itself in his keen sensitiveness to rhythmic effect. At 14 he entered the sophomore class of Oglethorpe College, Georgia, and after three years graduated with distinction. He was tutor in the college until the outbreak of the Civil War, when he joined the Confederate Army as a private soldier. He fought in several important battles, was transferred to the signal service and finally became signal officer of a blockade runner. In the autumn of 1864 he was captured and confined in Point Lookout Prison. He had taken advantage of every leisure moment to pursue his studies in literature, modern languages and music, and during his long idle hours in prison he gained a complete mastery of the technique of the flute. He was released in February 1865 and made his way on foot to Macon, but the fatigue of the journey added to the previous hardships of camp and prison caused a severe illness which did irreparable damage to his lungs. The years that followed were years of hand-to-hand fight for a subsistence. For two years he was

clerk in a hotel in Montgomery, and there wrote his novel 'Tiger Lilies,' a book of power and promise, but hastily written and poorly sustained; he taught at Prattville, Ala., and studied and practised law with his father for five years in Macon. In December 1867 he married Miss Mary Day of Macon, and her belief in his genius, her willingness to endure with him privation and hardship made possible the valiant struggle and the achievement of the next 14 years. In the autumn of 1873, after an unsuccessful attempt to re-establish his health by a winter in Texas, he determined to move to Baltimore, where he could find greater opportunities for culture. He played the flute in the Peabody orchestra; in the intervals of hemorrhage he wrote articles for magazines; he gave lectures on literature in private schools; and thus, with the generous aid of his father, he supplied the necessities of his family. His study of languages, of Anglo-Saxon and early English texts, of English and of foreign literature, was incessant and systematic. In February 1879 he was appointed lecturer on English literature at the Johns Hopkins University, and this position he held until his death. His two principal courses of lectures at the university are embodied in his 'Science of English Verse' (1879), a thorough and suggestive treatise on English metre, declaring that English verse depends on stress, not accent, and that it is based on certain easily recognized musical rhythms, and 'The English Novel,' a masterly treatment of the development of the idea of personality and its place in the modern novel. Again and again Lanier was driven by illness to Texas, to Florida, to North Carolina, but he was never idle; he studied much, he thought largely on all vital subjects, on love, life, art, economics, religion, and now and then he gave to the world poems of exquisite truth and beauty. In the spring of 1881 it became evident that the unequal fight was nearing its end, and as a last resort he tried tent life in the mountains of North Carolina. The last illness came at Lynn, in Polk County, and on a morning of early September he passed away.

Lanier's most important prose works besides those already mentioned are 'The Boy's Froisart' (1878); 'The Boy's King Arthur' (1880); 'The Boy's Mabinogion' (1881); 'The Boy's Percy' (1882); 'Shakespeare and his Forerunners' (1902). His best-known poems are 'Hymns of the Marshes'; 'Clover'; 'The Song of the Chattahoochee'; 'The Crystal'; 'Corn'; 'The Symphony' and 'The Centennial Meditation.' The distinctive characteristics of his poetry are a wholesome outlook upon life, a constant recognition of the highest in character and in thought and a varied fresh and melodious rhythm. His passion for good and love, his robustness, his high conception of the meaning and power of the love of man and woman, proclaim his close kinship to Browning. In questions of social economics Lanier was abreast of his time; he believed in the rights of the individual, he hated the iron hand of unjust trade, but he realized that these problems must be solved in the "patient modern way." He knew that the great poet must be an artist in sound and color, as well as a thinker, and that no labor was too arduous for perfecting verse forms; to attain perfection in his art the poet must make the mechanical verse fulfil its

vast possibilities, he must gain the mastery over imagination, so that imagination may become his servant. But for Lanier there was no art for art's sake; art was consecrated to man and to God. Like all true poets he lived near to nature, and he has described our Southern scenery with loving faithfulness warmed by vivid imagination. He has given new meaning to "our forests of live-oak beautifully braided and woven with intricate shades of the vine; to our broad fronded fern and keen-leaved canes." The luxuriance of the Southern forests, the wealth of undergrowth, the warmth, the color, the singing birds live in his poetry, but there is no undue heat, no tropical languor. Whittier has not been more faithful to the rocky coasts, to the snowstorms of New England, than has Lanier to the South. His letters and complete poems were edited by his widow with a memoir by William Hayes Ward (New York 1881, 1884, 1906), with bibliography. Consult also 'The Lanier Book' (New York 1904), and Nims, 'Sidney Lanier' (Boston 1905).

EMILIE W. McVEA,
*Late President Emeritus of Sweet Briar College,
Sweet Briar, Va.*

LANJUINAIS, län'zhwe'nä', Jean Denis, COUNT DE, French statesman: b. Rennes, 12 March 1753; d. Paris, 13 Jan. 1827. He took his degree as doctor of laws at 19 years of age and was qualified for the bar at that time. He was appointed counsel for the Breton estates and was a successful legal practitioner when he became professor of ecclesiastical law at the University of Rennes in 1775. He was a deputy in the States-General in 1789 and demanded the abolition of titles of nobility, working valiantly for a constitutional monarchy meanwhile. At the Convention of September 1792 he was charged with reactionary views; but while opposing the extremes of the Mountain and its following, Lanjuinais remained faithful to Republican principles. He denied the right of the Convention to condemn to death Louis XVI, but voted for banishment in the hope of saving the monarch's life. He came under arrest with the Girondins but escaped to Rennes and concealed himself until after the downfall of Robespierre. He returned to the Convention on 8 March 1797 and was president of the Upper House during the Hundred Days. He opposed Napoleon and upon the restoration of the Bourbons he was created a peer. As a member of the tribunal which tried Marshal Ney he voted for exile. He wrote 'Constitutions de la nation française' (1819); 'Appréciation du projet de loi relatif aux trois concordants' (1806; 6th ed., 1827); 'Études biographiques et littéraires sur Antoine Arnauld, P. Nicole et Jacques Necker' (1823), etc. His collected works were published in four volumes in Paris (1832).

LANKESTER, Edwin, English scientist: b. Melton, 23 April 1814; d. 30 Oct. 1874. His early medical studies were attended with difficulty, he had a short course at the University of London, and took his M.D. at Heidelberg in 1839. In 1840 he settled in London as a lecturer and writer, and in 1850 he became professor of natural history at New College, London. He was appointed lecturer on anatomy and physiology at the Grosvenor Place School

in 1853, and in 1853–71 was joint editor of the *Quarterly Journal of Microscopic Science*. His microscopic examination of the water from the "Broad Street Pump," undertaken with Dr. Snow, identified the outbreak of the cholera epidemic of 1854 with the famous pump. He was an indefatigable and popular worker on matters concerning sanitation and public health, many of his articles and lectures being prepared for the layman. His work was taken up by the National Health Society. In 1855 he edited for the prince consort William Macgillivray's 'Natural History of the Dee Side and Braemer' (privately printed). He contributed the article 'Rotifera' to the 'Cyclopædia of Anatomy and Physiology,' and wrote a school manual, 'Health, or Practical Physiology' (1868); 'Lives of Naturalists' (1842); 'An Account of Askern and its Mineral Springs' (1842); 'Half-hours with the Microscope' (1859), etc.

LANKESTER, Sir Edwin Ray, English zoologist: b. London, 15 May 1847; d. 1929; educated at Downing College, Cambridge, and Christ Church, Oxford; elected a Fellow and lecturer of Exeter College, Oxford, in 1872; 1874–90 he was professor of zoology and comparative anatomy in University College, London, and from 1891 till 1898 Linacre professor of comparative anatomy at Oxford. From 1898–1907 he was director of the natural history department of the British Museum. In 1884 was prominent in founding the Marine Biological Association, now located at Plymouth, and in 1869 became chief editor of the *Quarterly Journal of Microscopical Science*. Lankester's works include the following: 'A Monograph of the Fossil Fishes of the Old Red Sandstone' (Part I, 1870); 'Comparative Longevity in Man and the Lower Animals' (1870); 'Developmental History of the Mollusca' (1875); 'Studies in Apus, Limulus, and Scorpion' (1881); 'On Food' (1882); 'The Advancement of Science' (1890); 'Extinct Animals' (1905); 'The Kingdom of Man' (1907); 'From an Easy Chair' (1908); 'Science from an Easy Chair' (1910–12); 'Diversions of a Naturalist' (1915); 'Great and Small Things' (1923).

LANMAN, Charles, American author: b. Monroe, Mich., 14 June 1819; d. Washington, D. C., 4 March 1895. He was educated at the Academy of Norwich, Conn., and went to New York, where he was in business from 1835 to 1845. He then returned to Monroe as editor of the *Gazette*. He afterward joined the staff of the *National Intelligencer* at Washington, D. C. He was private secretary of Daniel Webster in 1850 and secretary to the Japanese legation in Washington in 1871–82. He was at various times librarian of the War Department, librarian of copyrights, of the Interior Department and of the House of Representatives. He prepared the first Congressional biographical directory. He was among the first to explore the mountains in North Carolina. He painted many landscapes and made many sketching trips. He published in all about 32 volumes, including 'A Tour to the River Saguenay' (1848); 'Private Life of Daniel Webster' (1852); 'Dictionary of Congress' (1858); 'The Japanese in America' (1872); 'Leading Men of Japan' (1883); 'Biographical Annals

of the Civil Government of the United States' (1876); 'Haphazard Personalities' (1886), etc.

LANMAN, Charles Rockwell, American Orientalist: b. Norwich, Conn., 8 July 1850; d. Boston, Mass., 20 Feb. 1941. He was graduated from Yale in 1871; and from 1873 to 1876 pursued studies in Orientalism at Berlin, Tübingen and Leipzig, returning in the latter year to accept a fellowship at Johns Hopkins University. In 1880 he became professor of Sanskrit at Harvard. He lectured at many institutions on Oriental subjects, traveled extensively, and from 1879 to 1884 was secretary of the American Philological Association, edited its *Transactions* (Vols. X–XIV), and in 1890 became president of the association. He was corresponding secretary of the American Oriental Society from 1884 to 1894 and in 1896, and served it as vice-president from 1897 to 1907, when he became its president. His published works include 'Noun-Inflection in the Veda' (1880); a 'Sanskrit Reader, with Vocabulary and Notes' (1884–88); 'The Beginnings of Hindu Pantheism' (1890); 'Rāja-Cekhara's Karpūra-mañjarī,' a translation of a Hindu drama of 900 A.D. (1900); and numerous contributions to Oriental and other journals. He projected the 'Harvard Oriental Series' (1891), to which he made several contributions. He received the degree of LL.D. from Yale in 1902, and from Aberdeen University in 1906. In 1909 appeared his 'Pāli Book-Titles and their Brief Designations,' in 'Proceedings' of the American Academy of Arts and Sciences (Vol. XLIV, pp. 661–707, Boston).

LANNER, Joseph Franz Karl, Austrian musical composer: b. Vienna, 12 April 1801; d. there, 14 April 1843. He early showed an aptitude for music, playing the violin and composing music before he had any instruction. He established a quartet with the elder Strauss as viola, which proved the nucleus of a great orchestra. Lanner's genius ran to dance music and he developed the modern waltz from the old Viennese national dance *ländler*. He composed 208 marches and dances, and is generally acknowledged the father of modern dance music.

LANNER, the name of a small "noble" falcon formerly in high repute among European falconers of mediæval times, the identity of which, however, is not quite clear. It was probably the handsome reddish-gray *Falco feldeggii* of the Mediterranean region, still highly valued among Bedouin falconers for its docility and graces. The name is extended to other African and Asiatic hawks of similar appearance and qualities.

LANNES, län', Jean, DUKE OF MONTEBELLO, marshal of France: b. Lectoure, 11 April 1769; d. Vienna, 31 May 1809. He had a scanty education but his physical prowess caused him to be made sergeant in the battalion of volunteers which he joined in 1792 for service in the war with Spain. He had attained rank as colonel when in 1795 army reforms caused his loss of rank. He re-entered the army as a volunteer and went with Napoleon to Italy, and in 1797 rose to the rank of brigadier-general. He had by this time demonstrated to Napoleon his extraordinary ability for hard advanced guard fighting against any odds and

the great Corsican thereafter used him repeatedly to prepare the way for his own crushing attacks. He commanded a brigade in the Egyptian campaign; he accompanied Napoleon to France and distinguished himself at the 18th Brumaire. He was again in command of the advance guard in crossing the Alps in 1800, and at the Battle of Montebello so aided Napoleon that he was created a duke, taking his title from the name of the battle. At Marengo he successfully conducted the hardest fighting.

Lannes was ambassador to Portugal in 1801, and in 1804 he became a marshal of France. At Austerlitz he commanded the advance guard, and in the campaigns of 1806-1807 he rendered signal services. His method at Saalfeld is still studied as a model in the French Staff College. He won further laurels at Jena and at Friedland, then went with Napoleon to Spain as commander in chief of an army with which he won the Battle of Tudela, Nov. 22, 1808. He then engaged in the siege of Saragossa, of which he took possession Feb. 21, 1809. Later in 1809 he was again engaged in an Austrian campaign, leading the army across the Danube. During the retreat from the battlefield of Aspern-Essling, May 22, 1809, he exposed himself recklessly, as was his wont, and was wounded, dying at Vienna. Napoleon entertained for him a deep affection and was bitterly grieved at his loss. He was one of the ablest of the marshals of France, possessing signal ability for high command, and remarkable daring and strength as a leader.

LANOLIN, the commercial designation of a fatty substance obtained from the grease of sheep's wool, and consisting principally of cholesterol. It is soluble in alcohol, in ether, and also in benzene. The wool grease is saponified by means of caustic soda, and the resulting emulsion is diluted with water. The lanolin then separates in fine particles, which, by the aid of a centrifugal separator, may be obtained in a creamy mass. The lanolin of commerce contains about 30 per cent of water. Lanolin is very generally used as a basis in the preparation of salves and ointments, since it does not grow rancid, and is itself antiseptic to a certain extent. It absorbs water, and it is widely believed that it penetrates the tissues of the body much more freely than lard or vaseline, although this has not been borne out by experiments.

LANSBURY, länz'bēri, **George**, English Labour Party leader: b. near Lowestoft, Suffolk, Feb. 21, 1859; d. London, May 7, 1940. He was educated in London and in 1884 emigrated to Queensland, Australia, but returned in the next year, settling in London in the timber business. He soon came under the influence of the Christian Socialists, but in 1890 joined the Socialist Party (then the Social Democratic Federation). He was defeated in attempts (from 1895) to enter Parliament, until 1910 when he became member for Bow and Bromley. In 1912, however, standing as an independent in favor of woman suffrage, he was defeated. He was again member for Bow and Bromley from 1922 until his death. Lansbury was mayor of Poplar, 1919-1920 and 1936-1937, first commissioner of works, 1929-1931, and leader of the Labour Party in the parliamentary opposition from 1931 until 1935, resigning because, as a pacifist, he could not support the rearmament program and the

League of Nations sanctions against Italy. Lansbury edited many Labour Party periodicals, notably the *Daily Herald*, from 1912 to 1922.

LANSDALE, länz'däl, borough, Pennsylvania; in Montgomery County; altitude 355 feet. It is situated 21 miles north of Philadelphia, on the Reading Railroad. A residential town in a dairy and poultry region, it manufactures hosiery, clothing, electronic equipment, tiles, and metal products. There is a public library and a hospital. It was incorporated in 1872. Pop. (1950) 9,762.

LANSDOWNE, 1st Marquis of; more generally known as Lord Shelburne. See **SHEL-BURNE**, **WILLIAM PETTY FITZMAURICE**, **LORD**.

LANSDOWNE, länz'doun, 5th Marquis of (**HENRY CHARLES KEITH PETTY-FITZMAURICE**), British statesman: b. London, Jan. 14, 1845; d. Clonmel, Ireland, June 3, 1927. He was educated at Eton and Oxford, and entered politics as a member of the Liberal Party. He was one of the lords of the treasury, 1869-1872; undersecretary for war, 1872-1874; undersecretary for India, 1880; and from 1883-1888 governor general of Canada. From 1888 to 1893 he was viceroy of India; from 1895 to 1900 he was in Lord Salisbury's government as secretary of state for war; and from 1900 to 1905 was secretary of state for foreign affairs. His tenure of office in the last-named post was marked by the further cementing of the alliance with Japan and the growth of the entente with France.

The rejection by the House of Lords under his leadership of David Lloyd George's budget of 1909 was followed by the passing of the Parliament Act of 1911 which curtailed the powers formerly possessed by the House of Lords. Lord Lansdowne was a member of the Asquith coalition government from 1915 to 1916 as a minister without portfolio. His inopportune letter to the *Daily Telegraph*, Nov. 29, 1917, asking for a more definite statement of Allied war aims in the hope of shortening World War I, raised a storm in the press and led to unfair accusations of disloyalty.

LANSDOWNE, länz'doun, borough, Pennsylvania; in Delaware County; altitude 205 feet. It is situated 5 miles west of Philadelphia, on the Pennsylvania Railroad. Lansdowne is a residential suburb of Philadelphia, with a few small industries, including steel castings, paper, bluing, abrasives, and food coloring. It was incorporated in 1893. Pop. (1950) 12,169.

LANSFORD, länz'fērd, borough, Pennsylvania; in Carbon County. It is situated 28 miles south of Wilkes-Barre, on the Lehigh and New England Railroad. Located in the center of the Panther Creek Valley anthracite coal fields, it has extensive coal mining interests, and manufactures clothing, drugs, and chemicals. It was settled in 1845, incorporated in 1876, and named for Asa Lansford Foster, mining engineer. Many old Slavic customs are observed by miners who are of Slavic descent. Pop. (1950) 7,487.

LANSING, **John**, American jurist: b. Albany, N. Y., Jan. 30, 1754; d. Dec. 12, 1829(?). He studied law in Albany and New York; was engaged in practice at the beginning of the revolution, during a period of which he served as

military secretary to Gen. Philip J. Schuyler. In 1784 he was elected to Congress, and while a member of that body was elected to the lower house of the New York legislature, where he was chosen speaker in 1786, in which year he also became mayor of Albany. For a short time he represented New York, in the Constitutional Convention (1787), which he left because he held that he had been sent to participate in an amendment of the Articles of Confederation and not in the forming of a new constitution. In 1788, at the New York convention, his opposition to the ratification of the Constitution was stoutly maintained. From 1801 to 1814 he was chancellor of the state. He declined the Anti-Federalist nomination for governor of New York in 1804. He disappeared mysteriously in New York City on Dec. 12, 1829, after having quitted his hotel to post a letter on a wharf nearby.

LANSING, Robert, American statesman: b. Watertown, N. Y., Oct. 17, 1864; d. Washington, D.C., Oct. 30, 1928. After graduating from Amherst College he was admitted to the New York bar and began to practise law in his native town. On various important occasions he was engaged by the United States government on international questions, among them the Bering Sea Fur-Seal Arbitration (Paris 1892-1893), in which he served as counsel and technical delegate; the Bering Sea Claims Commission (1896-1897), Alaskan Boundary Tribunal (1903), North Atlantic Coast Fisheries Arbitration (1909-1910) and the American and British Claims Arbitration (1912-1914). He was appointed counsellor for the Department of State in March 1914. On the unexpected resignation of William Jennings Bryan from the office of secretary of state on June 8, 1915, President Wilson on the following day authorized Lansing to perform the duties of that office "for a period not to exceed thirty days, until a Secretary shall have been appointed and have qualified." The subsequent definite appointment of Lansing as secretary of state proved a fortunate choice. In the delicate negotiations with foreign powers which he conducted during 1915, 1916, and 1917, he displayed a statesmanlike breadth of view and a judicial grasp of essential points. The unrestricted submarine policy of the German government, involving diplomatic duels with ambassadors and foreign offices, and the intricate problems arising under international law from the British and French attitude with regard to the rights of search and blockade, in addition to many other thorny questions concerning the difficulties of neutrality, were alike handled by him with diplomatic skill and tact. He was a member of the American delegation to the Paris Peace Conference. Differences regarding foreign policy led to an estrangement with President Wilson, and, in February 1920, he resigned.

LANSING, city, Michigan, state capital, in Ingham County, lies at an altitude of about 860 feet (capitol cornerstone), in the south central part of the Lower Peninsula, at the junction of three rivers—the Grand, Red Cedar, and Sycamore. These rivers wind through the city and are spanned by bridges. The capital city is located in a rich agricultural area, 46 miles southwest of Flint and 84 miles northwest of Detroit by air; and is served by the Chesapeake and Ohio (Pere Marquette Divi-

sion), the New York Central, and the Grand Trunk railroads. For motor transportation, Lansing has federal and state highways which converge on it from all directions. Three miles northwest of the city is a state-owned airport which has scheduled airline service. The importance of Lansing does not depend upon its political position alone; it is a manufacturing and banking center, and a shopping point for central Michigan. Among the products of the city's manufacturing plants are automobiles, trucks, trailers, tractors, lawnmowers, wheels; spraying, fire-fighting, and garage equipment; tools and dies, tents and awnings, chemicals, beet sugar, and flour. Banking institutions include a national bank, two state banks, a trust company, and three building and loan companies.

The city, 14.5 square miles in area, has a mayor-council form of government and is practically debt free (1951). While natural gas is supplied by a private company, the city owns the electric light and power system. In addition to its 30 public schools, Lansing's educational facilities include 5 parochial and 3 business schools, 2 state institutions—the Michigan School for the Blind and the Michigan Vocational School for Boys; and at its doorstep (in East Lansing, q.v., which adjoins the capital and is its cultural center) is the Michigan State College of Agriculture and Applied Science (q.v.). Lansing has a public library; and the state library, containing some 500,000 volumes including an important collection of Michigania, is located in the Michigan State Office Building. In February 1951, an incendiary fire in this building destroyed about 25,000 volumes, and badly damaged a larger number. The extension service of the state library serves institutions throughout Michigan, including schools and other libraries. The State Office Building also contains a historical museum with exhibits of Michigan pioneer and Indian relics. Nearby and situated on spacious grounds is the capitol (1878), built of white sandstone, 420 feet in length, 273 feet in depth, and 276 feet high. Quite different is another of Lansing's interesting buildings—the Olds Tower, a narrow skyscraper of an office building, 345 feet in height.

History.—Lansing had already been named for a village in New York from which some of its few settlers had come when, in 1847, it became the state capital, replacing Detroit. When Michigan's legislators chose the site, Lansing was a dense forest interrupted only by a saw mill and a single log house, erected in 1843. As soon as the decision was made to move the capital, newcomers flocked to the site to take advantage of the news. By 1859, when Lansing was incorporated as a city, it had several small manufactures, stores, hotels, a newspaper, a school, a college for women, the state college in what is now East Lansing, and a brick capitol replacing an earlier frame building. The following year, when Lansing's first federal census was taken, the city's residents numbered 3,074. The city's future was uncertain, however, until 1871. Then the first railroad reached it, giving more promise of commercial and industrial possibilities, and the city's political position was finally settled by the legislature's decision to build a new (the present) capitol there. Lansing was soon one of the important centers in the state for the manufacture of carriages, wheels, and wagons. Rapid growth, however, came

about the turn of the 20th century when Ransom E. Olds formed the two companies that introduced the public to Oldsmobiles and Reo motor cars. The manufacture of automobiles in Lansing stimulated allied industries there. In 1890, Lansing's population was 13,102; by 1920, it had risen to 57,327. In 1950, it totaled 91,694.

LANSING MAN, a term applied to a collection of human bones, found near Lansing, Kans., 20 feet below the surface of the earth, under a stratum of carboniferous limestone. The skull, which was well preserved, measured: maximum length, 188 mm.; breadth, 138 mm.; cranial index, 73.4. From the date of this discovery in 1902, men of science have been divided in their opinion as to the antiquity of the remains. It is now generally agreed that the skull does not represent an ancient type of man. The skull is preserved in the United States National Museum, Washington, D.C.

LANSON, län-sôn', **Gustav**, French critic: b. Orléans, Aug. 5, 1857; d. Paris, Dec. 15, 1934. He was educated at the Lycée d'Orléans, the Lycée Charlemagne and the École Normale Supérieure, receiving the degree of doctor of letters. He engaged in the teaching of rhetoric and later became professor of French literature at the University of Paris, and at one time he was engaged in teaching in the United States where his methods have been adopted by several universities. He was a member and officer of several French literary societies and an officer of the Grand Legion of Honor. His works include *Nivelle de la Chaussée et la Comédie Larmoyante* (1887); *Histoire de la Littérature Française* (1894; 2 vols., 1923); *L'Idéal Français dans la Littérature, de la Renaissance à la Révolution* (1928).

LANSQUENET, län'skë-nët, the name given during the late 15th and 16th centuries to the German mercenaries in France, the word being a French corruption of the German *Landsknechte*. They were found fighting on both Catholic and Protestant sides in the wars of religion, and usually fought as separate units under their own officers.

LANSQUENET, a card game for several players. A full pack of 52 cards is used, or sometimes two packs shuffled together. It is a species of banker game. The dealer being determined, he places the two top cards face upwards upon the table. These form the hand cards, and no bets can be made upon them. He then proceeds to give one faced card to himself, and one to each player or punter. If any card dealt is of the same denomination as either of the hand cards, it must be placed upon them. The banker continues to turn cards from the top of the pack so long as his own remains unpaired by one of a similar denomination. Should he draw a similar card to his own, the other players win all their stakes. But each time he pairs one of the players' cards, the banker appropriates all stakes upon that particular card. As each card is matched, the banker withdraws that pair.

LANTERN, an enclosure for a light protecting it from the wind. Lanterns were used by the ancients in augury. They were also carried before troops on the march by night, being then borne on the top of pikes, and so

constructed as to throw the light backward. Dark lanterns are provided with only a single opening, which can be closed up when the light is required to be hidden, or opened when there is occasion for its assistance to discover some object. See also **LAMP**.

In *architecture*, a small structure on the top of a dome, or in other similar situations, for the purpose of admitting light, promoting ventilation, or for ornament, of which that on the top of the capitol at Washington may be referred to as an example. In Gothic architecture the term is sometimes applied to *louvers* on the roofs of halls, etc., but it usually signifies a tower which has the whole height, or a considerable portion of the interior, open to view from the ground, and is lighted by an upper tier of windows. Notable examples are the Cimborio of Burgos Cathedral, the celebrated example of Coutances Cathedral, Normandy, and the equally famous octagon of Ely Cathedral.

The elaborate lighting fixture, with its prisms, in a lighthouse.

LANTERN FISH, a general term for the luminous fishes of the depths of the sea, most of which belong to a single group (Iniomi).

LANTERN FLIES, homopterous bugs with membranous forewings concealing the folded hinder wings when the insects are at rest, and the head greatly prolonged and said to be light-giving in some tropical species. They feed upon plants and deposit their eggs in slits cut in the bark. The best-known species is the candle fly (*Fulgora laternaria*) of tropical America, but the luminosity alleged of it is an old story not recently verified. Many other popular beliefs are attached to the insect. It is said in Brazil, for instance, to be so poisonous that anything against which it strikes its long beak will fall dead.

LANTERN OF DEMOSTHENES. See **LYSICRATES**, **MONUMENT OF**.

LANTERN SLIDE, a transparent picture on glass used for projection on a screen by an optical or magic lantern. Though they were formerly largely painted by hand, lantern slides are now chiefly photographs on glass, made by printing from negatives on plates coated with emulsion as for bromide paper, or, commercially, by the wet-collodion process. The finished slide is bound up with a protecting cover glass.

LANTERNS, **Feast of**, a religious ceremony held in China on the 15th day of the first month of the year. It derives its name from the vast number of lanterns which are hung out of the houses and in the streets. The lanterns used are often of great value, being richly ornamented with gilding, painting, japanning and sculpture, and some of them are of great size, reaching nearly 30 feet in diameter, and are so constructed as to resemble halls or chambers.

LANTHANUM, län'thà-nüm, a rare metallic element resembling cerium in its general properties, discovered by Mosander, in 1839, in the Swedish mineral cerite. It has the chemical symbol La, and an atomic weight (for O = 16) of 138.19. Its melting point is between that of antimony (840°F.) and silver (1740°F.). It has

a specific gravity of 6.16, and a specific heat of 0.0448. It is a white metal, moderately ductile and malleable. It oxidizes rapidly upon exposure to the air, and decomposes water slowly when cold, and rapidly when hot. It dissolves readily in acids, with the formation of corresponding salts, which are mostly colorless, with an astringent taste. The metal is prepared by the reduction of its chloride by metallic potassium, and the subsequent removal of the potassium chloride that is formed, by washing with alcohol. Neither lanthanum nor its salts are of any industrial importance. The name is from a Greek word meaning "concealed" in allusion to the fact that lanthana, the oxide, was for a time confused with the oxides of other rare metals belonging to the cerium group. Lanthanum occurs, as a silicate, in the minerals cerite, gadolinite, orthite and allanite; as a carbonate in lanthanite occurring in Lehigh County, Pa., and Essex County, N. Y.

LANZA, län'tsä, **Gaetano**, American mathematician and engineer: b. Boston, 26 Sept. 1848. He was educated at the University of Virginia, and for two years was an instructor there; was an instructor and assistant professor at the Massachusetts Institute of Technology (1872-75); professor of theoretical and applied mechanics (1875-1911), in charge of the department of mechanical engineering (1883-1911), and after 1911 professor emeritus. He served at various times as consulting engineer and in 1906-11 was president of the Mathematical and Physical Club. He was a Fellow of the American Academy of Arts and Sciences, a member of the British Association for the Advancement of Science, and of other scientific bodies here and in Europe. He published 'Applied Mechanics' (1885; 9th ed., 1905), and 'Dynamics of Machinery' (1911), and his writings include many papers presented to scientific societies. He died in 1928.

LANZAROTE, län-thä-rö'tä, one of the Canary Isles, the most easterly of the group, about 90 miles from the African coast; area, 235 square miles; greatest length, 31 miles; breadth, 5 to 10 miles. Its coast is in general very bold, and presents ranges of basaltic cliffs rising in some parts to 1,500 feet; its interior is rough in surface, and contains several mountains, the loftiest of which has a height of 2,000 feet. The only port of any consequence is Arrecife. Pop. 19,261.

LANZI, län'tsē, **Luigi**, Italian antiquary and art critic: b. Monte dell' Olmo, near Macerata, 1732; d. Florence, 30 March 1810. He was educated for the priesthood, entering the order of the Jesuits. He became keeper of the galleries of Florence in 1773 and through study and research became an authority on Italian painting and Etruscan language and antiquities. He was buried beside Michelangelo in the church of Santa Croce at Florence. His writings include 'Storia Pittorica della Italia' (1792, 1796); 'Saggio de lingua Etrusca' (1789); 'Saggio delle lingua Italia antiche' (1806); 'Dei vasi antichi dipinti volgarmente chiamati Etruschi' (1806), etc. He also wrote verse, edited and annotated Hesiod, 'Works and Days,' and he wrote a number of treatises on spiritual subjects.

LAO-TSE, lä'ö-tsä, or **LAO-TSEU**, Chinese philosopher: b. Kih-jin about 604 a.c. The

date of his death is unknown, but some early writers think he attained the age of 160. His primal name was Li Uhr, but as he became distinguished he was called Lao-tse, or venerable philosopher. He was the founder or reformer of one of the most ancient and important religious sects of China, known as the Tao or sect of reason. He was a historiographer and librarian to a king of the Chow dynasty; traveled to the borders of India, where he may have become acquainted with Buddhism; met Confucius and reproached him for his pride, vanity and ostentation; was persuaded to record his doctrines in a book, which he did in the 'Tao-ti-king' or 'The Path to Virtue'; and on completing this task is reputed to have disappeared into the wilderness, and there ascended to heaven. According to him silence and the void produced the Tao, the source of all action and being. Man is composed of two principles, the one material and perishable, the other spiritual and imperishable, from which he emanated, and to which he will return on the subjugation of all the material passions and the pleasures of the senses. Lao-tse's moral code is pure, inculcating charity, benevolence, virtue and the free-will, moral agency and responsibility of man. Since the 2d century of our era the sect has continued to extend over China, Japan, Cochinchina, Tonquin and the Indo-Chinese nations. See TAOISM.

LAOAG, lä-wäg', Philippines, capital of the province of Ilocos Norte, Luzon, on the Grand de Laoag River, four miles from its mouth. It is picturesquely situated in a fertile plain and is well built; it is open to the coastwise trade and is the centre of shipment for the agricultural products of the region. Rice, indigo, tobacco and sugar are the principal products. The name signifies "clearness" from the fact that the sky and atmosphere are almost continuously clear. Pop. about 47,024.

LAOCOÖN, lä-ök'ö-ön, a priest of Apollo at Troy. As he was sacrificing a bull to Poseidon on the shore, two serpents swimming from the island of Tenedos advanced to the altar. The people fled, but Laocoon and his sons fell victims to the monsters. The sons were first attacked, and then the father. Winding themselves round him, the serpents raised their heads high above him, while in his agony he vainly endeavored to extricate himself from their folds. They then retired to the temple of Pallas Athene, where they took shelter under her shield. The people saw in this omen Laocoon's punishment for his impiety in piercing with his spear the wooden horse consecrated to Athene. The story has frequently furnished a subject to the poets, but it is chiefly interesting to us as having given occasion to a fine work of sculpture—the Laocoon group, now in the Vatican. It was discovered in 1506 on the site of the baths of Titus. Pope Julius II bought it and placed it in the Vatican. Its preservation was perfect, except that the right arm of Laocoon was wanting: this was restored by a pupil of Michelangelo. This group is of the dramatic Rhodian school, and by no means belongs to the best style of Greek sculpture. Yet it has been much treated of in literature, especially by Goethe, Heine, Lessing, Winckelmann and Herder. It represents three persons in agony, but in different attitudes of struggle

or fear, according to their ages. Pliny declares it was made of one stone by the sculptors Agesander, Polydorus and Athenodorus, all natives of Rhodes, and the two latter probably sons of the former.

Lessing makes it probable that those three artists lived under the first emperors. It may be fairly doubted whether the statue mentioned by Pliny is the same as that we now have; acute observers have found that the group does not consist of one block, though the junctions are carefully concealed. To this it may be answered that they were not perhaps perceptible in the time of Pliny. Several copies have been made; one in bronze, from a model by Giacompo Tati or Sansovino, which was carried to France. Baccio Bandinelli made a copy which is in the Medici Gallery at Florence.

LAODAMIA. Wordsworth's 'Laodamia,' published in 1815, is a narrative poem in stanzas dealing with the classical story of Protesilaus, a Greek hero who sacrificed himself in fulfillment of the oracle which declared that victory should be the lot of that party from which should fall the first victim in the Trojan War. According to the legend, as narrated by Wordsworth, Laodamia, the wife of Protesilaus, prays to the gods that her husband may return to her from Hades. He does so and relates the story of his death at the hands of Hector, rebuking the excessive passion of his wife, who cannot bring herself to consent to his return to the shades of death. Summoned by Hermes the spectre departs, leaving Laodamia a lifeless corpse upon the palace floor. The poem closes with a description of the trees which grew from the tomb of each and withered at the top when they had attained such a height that they commanded a view of the walls of Troy. The underlying idea of the poem is the weakness of the soul exemplified in Laodamia, whose uncontrolled love makes her incapable of lifting her heart to a "higher object" and accepting her husband's sacrifice and fate. Both the motive of the piece and its classical atmosphere reflect the change in point of view which Wordsworth experienced in his maturer years. (See *ONE TO DUTY*). Its beauty of style and calm nobility of tone make it one of Wordsworth's unquestionable masterpieces. The poem bears traces of the influence of Virgil, whom the poet was rereading at the time. In an earlier version Laodamia is more pitied than condemned. Later the ethics of the poem seemed to require her punishment. The present ending, adopted in 1845, is a kind of compromise. Consult notes in Dowden's 'Poems by Wordsworth' (Athenæum Press Series).

JAMES H. HANFORD.

LAODICEA, lā-ōd-ī-sē'a, the ancient name of eight places in Asia Minor including (1) Laodicea, now called by the Turks *Eski Hissar* (Old Castle), an ancient ruined city, once the capital of Greater Phrygia, 120 miles east of Smyrna, the site of one of the seven primitive Christian churches of Asia. Nothing but very extensive ruins of inferior architectural merit remain to point out the locality of this interesting city. (2) Now Ladik, a city of Lyconia, north of Iconium. (3) An ancient city of Syria, founded by Seleucus Nicator, which stood to the northeast of Baalbec, in a plain watered by the Marsyas.

LAODICEA, Council or Synod of, council held at Laodicea ad Lyceum in Phrygia in the 4th century. The exact time of the council is disputed, Hefele placing it between 343 and 381, while Baronius maintains 314 as the correct date, and other years as late as 399 are considered by different authorities. The council was composed of 32 bishops from the provinces of Asia and the results of its rulings are produced in 60 canons which were pronounced as binding upon the Christian creeds throughout the world by the Council of Chalcedon in 451. The canons are disciplinary in the main and make a privileged class of the clergy, but regulate strictly ritual, precedents, heresy, baptism, fasts, angel-worship and other matters of form and faith. From the list of canonical books notable omissions are those of the Apocrypha and the Revelation. The canons are published in Hardouin, 'Conciliorum Collectio' (Vol. I, 1875).

LAOKOON. To the scholarly world outside of Germany 'Laokoon' (1766) is probably better known than any other of Lessing's works—an interesting poem by Matthew Arnold testifies to its fame. It represents the culmination of a wave of critical inquiry which swept over the whole of western Europe; with regard to contemporary poetic practice it was a polemic of irresistible timeliness; and in every respect it is a characteristic work of its clear-headed and sure-handed author.

'Laokoon' has to do with the boundaries of painting and poetry. It delimits the respective fields of sister arts which have indeed much in common, but properly possess each a special sphere. Mutual accommodation may be expected of the sisters, and is provided for; nevertheless, either can only at her peril invade the peculiar domain of the other. So much had been recognized in Europe since the time of the Renaissance. Italians, Frenchmen and Englishmen—all of the more important of them known to Lessing—had for generations meditated and written on the problems that he treated, and some had endeavored to distinguish what belonged to one sister from what belonged to the other. But the prevailing tendency had been to assimilate, to evaluate and to compare, whereas he contrasted. Before Lessing two texts from antiquity had been thought to warrant emphasis upon likeness: Horace's phrase in the 'Art of Poetry' *Ut pictura poesis* ("as a picture is, so is poetry") and the saying attributed to Simonides of Ceos, "A picture is mute poetry; poetry is a speaking picture." There were recognized, however, the facts that speaking takes time, and sight may be momentary; that a mute object is an object in space, whereas words—the medium of poetry—neither are objects nor have any existence in space: in short, that both the matter and the manner of poetry and painting are, as Plutarch had declared, different one from the other.

Differences in manner or medium of artistic creation are manifest: forms and colors are in no sense like words or language. That the matter suitable to the two arts is also different was demonstrated by Diderot, when he invited attention to the treatment of one and the same subject in the two media, and showed how absurd would be the appearance on canvas of a man submerged up to his head, in spite

of the effective handling of such a scene in the poetry of Virgil.

This hint, and a similar one from Winckelmann and Moses Mendelssohn with reference to the statue of Laocoön, and Virgil's narrative in the second book of the *'Æneid.'* gave Lessing the starting point for his discussion;—for his discussion, not for the development of his ideas; these he had derived from consideration of the practice of Homer, a practice vividly brought to Lessing's attention by a passage in Burke's essay *'On the Sublime and Beautiful.'* Upon the basis of first principles discovered in Homer, Lessing built up his theory of the fundamental difference between poetry and painting. But the first 15 chapters of *'Laokoon'* pursue an inductive method to which he gave a casual air by taking up the views of three of his most distinguished predecessors: Winckelmann, Joseph Spence and Count Caylus. Then, in chapter 16, he formulated his results in dogmatic, deductive fashion, essentially as follows: The symbols, or means of expression, in painting are lines and colors; the symbols, or means of expression, in poetry are articulate words. Lines and colors are properties of bodies, the parts of which coexist in space; articulate words have no existence in space, but succeed one another in time. If, therefore, as is evident, there should be a suitable relation between the subject of artistic treatment and the means employed, the proper subject for painting is something, the constituent parts of which coexist in space, i.e., *bodies*; and the proper subject for poetry is something, the constituent parts of which succeed one another in time, i.e., movements or, in general, *actions*. Painting can represent action only suggestively, by means of bodies; poetry can represent bodies only suggestively, by means of action. Painting can represent only a single moment, but can suggest other moments; poetry can present a body to view, but will give it the aspect which it bears at a definite moment, the moment of mention. The painter will choose a pregnant moment, i.e., one which gives the imagination free play with cause and effect; and the poet will choose a significant aspect, i.e., one which gives the imagination a vivid picture of present reality. But the painter will suggest, he cannot tell, a story, and the poet will present, he cannot exhaustively describe, a body—instead, he will translate a work into the terms of an operation, and will transform beauty into grace. Grace is beauty in motion. Space is the realm of the painter; the realm of the poet is time.

Lessing's treatise was a protest against two abuses that ran riot in his day: excessive allegorizing in painting, excessive detailed description in poetry. Painting subordinated beauty to "poetic" substance and ran the risk of unintelligibility; "pictorial" poetry dissipated its energy in the vain endeavor to assemble the parts of extensive objects which defied imaginative unification. Lessing was more concerned with poetry than with painting; he was a poor visualizer, but quick to respond to sensory-motor appeal. Further, he cared more for ideas than for things, more for action than for being. His rationalistic mind dealt chiefly with the objective aspect of arts which must, in the last analysis, justify their methods by

their subjective effect upon the whole man, the sensuous even before the rational. But he made a theoretical distinction which is unsatisfactory, however much it may be subject to modification when applied to specific cases. Lessing himself was ready and willing to relax the rigidity of his demarcations. The *'Laokoon'* as we have it is but the first part of a treatise planned to comprehend music and dancing as well as painting and poetry. We need not regret that it remained a fragment. What the treatise gained in completeness it might have lost in incisiveness. The first part, that we have, is a masterpiece of composition, a work of art, in which discussion of abstract principles is made marvelously concrete and stimulating. Translated by Ellen Frothingham (Boston 1874), and by Sir Robert Phillimore (London 1874). Edited by W. G. Howard (New York 1910). Cf. Irving Babbitt, *'The New Laokoon'* (Boston 1910).

WILLIAM G. HOWARD,
Professor Emeritus of German, Harvard University.

LAOMEDON, Greek mythological character, son of Ilus, king of Troy and father of Priam (Podarces). By command of Zeus Laomedon was served by Apollo and Poseidon, Apollo tending his flocks and Poseidon building the walls of Troy which Laomedon founded. Laomedon refusing the compensation agreed upon the country was visited by a pestilence sent by Apollo and a sea monster sent by Poseidon. The oracle declared that relief could be obtained only by the sacrifice to the sea monster of one of Laomedon's daughters. Lots were cast and Hesione was chosen and chained to a rock to await the sea monster's coming. Here Hercules found her and promised to free her in exchange for the magic horses given to Tros, the father of Ganymede, to comfort him after the loss of his son. Laomedon again broke his word and Hercules returned, destroyed Troy, killed Laomedon and all his sons except Priam who had opposed his father's methods. Hercules carried away Hesione and placed Priam upon the throne. It was said that so long as the grave of Laomedon remained inviolate by the Scæan gate the walls of Troy would remain impregnable.

LAON, lān, France, capital city of the department of Aisne, 87 miles northeast of Paris. It has been from earliest times a fortified city, owing to its situation upon commanding ground. It was the ancient *Ladunum* and was fortified by the Romans in the 5th century. The invasions of the Franks, Vandals, Huns and others were checked here in early times; in the Hundred Years War Laon changed hands several times, being held successively by the Burgundians, English and French. Napoleon here was defeated by Blücher in 1814, and in the Franco-Prussian War Laon fell into the hands of the Germans. In the European War Laon again fell before the Germans in the autumn of 1914 and remained within the famous "Von Hindenburg line" until the closing campaign of 1918. The cathedral of Laon was built in the 12th and 13th centuries and is considered one of the most important Gothic structures in France. There is an old episcopal palace, now in use as a courthouse; the 13th century

gates of Ardon, Chenizelles, and Soissons; and the ancient abbey of Saint Vincent and the church of Saint Martin, built in the 12th century. It has sugar and metal-manufacturing industries, and is famous for its artichokes, asparagus, and fruits. Pop. (1946) 17,401.

LAOS, lä'ōz, or **LAOTIANS**, division of the Thai or Shan peoples of Indochina, occupying territory in northern Burma and also in the French associated state of Laos (q.v.). The Laos originally came from the Chinese provinces of Yunnan, Szechwan, and Kweichow, expelling the aboriginal Kha tribesmen. There are two distinct divisions of the Laos—the Lao Pong Dam, or North Laos, and the Lao Pong Kao, or Eastern Laos. They possess a written language, the Lao Pong Dam deriving theirs from the Burmese, while the Lao Pong Kao is similar to the Siamese. The physical characteristics of the Laos are low stature, yellow complexion, high cheek bones, small, flat nose, oblique eyes, black hair, and scanty beard. Their religion is Buddhism. While polygamy is practiced, it is rare, and the women of the Laos enjoy considerable freedom and are kindly treated. They have a distinct taste for music, their instrument being the *khen*, a mouth organ of rather sweet tone; and they have a considerable development of folklore. As a whole the Laos are lazy but peace-loving; they are superstitious, crediting disease to evil spirits and believing in werewolves. Men, women, and children alike are addicted to tobacco smoking. The Laos are of a friendly, pleasant disposition, too easygoing to compete successfully in commerce. Their chief occupations are along agricultural lines in connection with rice, silk, and the tending of herds. Such arduous labor as the cutting of teak timber in the forested mountains is performed for the most part by the wilder, primitive tribes.

LAOS, kingdom, French Indochina, an associated state of the French Union; it was formerly a French protectorate. The area is 89,320 square miles, and the population was estimated in 1949 to number 1,208,000. It is bounded on the north by the Chinese province of Yunnan, on the east by Viet Nam, on the south by Cambodia, on the southwest and west by Thailand, on the northwest by Burma. The country is mountainous, peaks in the north exceeding 9,000 feet and those in the south being some 5,000 feet in height. Most of Laos lies to the eastward of the Mekong, a river which forms the boundary with Burma and Thailand. Vientiane, the capital, is on the Mekong; other towns include Luangprabang and Thakhek. Laos has a drier climate than other parts of French Indochina; rains fall from June to October, during the southwest monsoon. Besides Laos the inhabitants include considerable minorities of Thais, aboriginal peoples, and Chinese. The country is rich in wild animals, including the elephant, tiger, and gaur. In the forests are many valuable hardwoods, notably teak, as well as bamboo and rattan. Large quantities of rice are cultivated, and other products include corn (maize), coffee, tea, sugarcane, tobacco, and citrus fruits. Tin, gold, and silver deposits are exploited, and there are also precious stones and copper and other minerals. There are no railroads in Laos, but good highways link the main centers of population. Although there are numerous waterways in the northern part of the

kingdom, transportation is hindered by many rapids and waterfalls.

Laos was not a single kingdom but numerous petty states prior to 1828, when the country was annexed by Siam. In 1893 France demanded that Siamese forces be withdrawn from all territory east of the Mekong, and Siam was forced to yield after a 10-day naval blockade of the capital city of Bangkok. The French government then established a single protectorate administration for the whole of Laos, which included the small state of Luangprabang, a native king having some restricted authority. In 1941, during World War II, the Japanese forces occupying French Indochina compelled Laos to cede three of its 11 provinces to Thailand, but at war's end these were restored to the kingdom. On July 19, 1949, France concluded a treaty with Laos recognizing the kingdom as an independent sovereign state within the French Union, and this was ratified by the president of France on Feb. 2, 1950. See also FRENCH INDOCHINA.

LAPAROTOMY, läp'à-rõt-ô-mi, surgical operation consisting of the opening of the abdomen by making an excision in the loin or flank in order to reach the abdominal cavity or pelvic viscera.

LAPEER, lä-pēr', city, Michigan, seat of Lapeer County, situated on the Flint River 20 miles east of Flint. It is served by the Michigan Central and the Grand Trunk railroads. The city is in a fertile agricultural region, and is an important trading center for poultry, grain, and dairy farms. At one period it was a center of the lumbering industry, and it now manufactures bookcases, cabinets, cedar chests, iron castings, equipment for aircraft, and insect exterminators. The county courthouse, erected in 1837, is the oldest now in use in Michigan; it was built by Alvin M. Hart, who settled here in 1831. Here, also, is the Michigan State Home and Training School for the feeble-minded and epileptic; constructed in 1895, it is a cottage institution with large grounds and farm. In close vicinity to the city is a summer resort and a state wildlife sanctuary. The flints found along the banks of the river probably suggested the name for the city, which is a corruption of La Pierre, French for stone. Lapeer was incorporated in 1868. Pop. (1940) 5,365; (1950) 6,116.

LAPHAM, läp'am, Increase Allen, American naturalist: b. Palmyra, N. Y., March 7, 1811; d. Oconomowoc, Wis., Sept. 14, 1875. Between 1825 and 1832 he was employed in the survey of the Erie Canal, the Ohio Canal, and the Welland and Miami canals. In 1833 he went to Columbus, Ohio, to become secretary of the Ohio State Board of Canal Commissioners, and there he also turned his attention to botany, meteorology, and geology. Removing to Milwaukee, Wis., in 1836, he dealt in real estate and undertook a thorough study of the climate, topography, geology, fauna and flora, resources, and commerce of Wisconsin. From 1873 until his death he was state geologist of Wisconsin. His many publications, which numbered more than 100, represented an immense amount of research. Among the best known of these publications are his *Wisconsin: its Geography and Topography, History, Geology, and Mineralogy*

to carry heavy burdens, but travelers have been amazed at their brawn and endurance. The life of a herder demands a strong physique. Mentally the Lapps are very alert, but neuroses are common as a result of their being confined to cramped quarters during storms and severe weather. These neurotic spells are referred to as Lapp Panic.

Even though Christianity was accepted early by the Lapps, many pagan practices continued. Thomas von Westen (1682-1727), a Norwegian clergyman and missionary, did much to combat superstition, and so did the brothers Lars Levi Laestadius (1800-1861) and Petrus Laestadius (1802-1841), who made a tremendous religious impact on these people of the north. The Lapps are a literate people; the first school, Den Skytteanska Lapp Skolan in Lycksele, was founded in the year 1631.

The modern Lapps are only a fragment of a once numerous and powerful people. Among their achievements are the domestication of the reindeer, now a worldwide business, and the invention of skis. Their greatest contribution is in the field of art: Lappish designs have influenced Swedish art greatly. In the field of music their contribution has not yet been properly evaluated, but their skill and refinement astonish the collector.

LAPLAND LONGSPUR. See LONGSPURS.

LAPOINTE, là-pwānt', **Ernest**, Canadian lawyer and politician: b. St. Eloi, Quebec, Canada, Oct. 6, 1876; d. Montreal, Nov. 26, 1941. Of French-Canadian parentage, he was educated at Rimouski College and Laval University, and called to the bar in 1898. From 1904 until his death, he sat continuously in the Canadian House of Commons and, after the death of Sir Wilfrid Laurier in 1919, was considered the chief spokesman of the French-Canadians. In 1922 he was Canadian delegate to the League of Nations in Geneva; in that year he negotiated and signed a treaty with France, and in the next year a treaty with the United States on Pacific fisheries, the first time a Canadian had been given full powers to act for the crown. Four other treaties with the United States bore his signature. With Premier William Lyon Mackenzie King, he represented the Dominion of Canada at the Imperial Conference of 1926. He was head of the Canadian delegation at the Imperial Conference of 1929, and a member of the delegation in 1937, when he was made a privy councillor.

When Mackenzie King became premier in 1921, Lapointe was appointed minister of marine and fisheries. Three years later he became minister of justice, serving until 1930 and again from 1935 until his death. He was also attorney general during the latter period, and often acted as deputy premier in Mackenzie King's absence. In 1939 he supported the entrance of Canada into the war, in spite of the opposition of a large proportion of his constituents, but opposed conscription.

LAPPARENT, là-pà-rān', **Albert Auguste Cochon de**, French engineer and geologist: b. Bourges, France, Dec. 30, 1839; d. Paris, May

5, 1908. After studying at the École polytechnique in Paris and at the École des mines, he was chosen a member of the staff to draw a geological map of France, and in 1874 was secretary of a committee which drew up plans for a submarine tunnel between France and England (never built). The next year he was appointed professor of geology and mineralogy at the Institut catholique in Paris and gave up his public appointments. He was distinguished for the remarkable simplicity of his scientific writings, which made popular and understandable textbooks. He published *Traité de géologie* (1882; 5th ed. 1906); *Cours de minéralogie* (1884; 3d ed. 1899); *La géologie en chemin de fer* (1888); *Leçons de géographie physique* (1896); *Le globe terrestre* (3 vols., 1899); *Science et apogée* (1905); *La philosophie minérale* (1910).

LAPPENBERG, läp'en-bërk, **Johann Martin**, German historian: b. Hamburg, Germany, July 30, 1794; d. there, Nov. 28, 1865. After graduating from the University of Edinburgh and studying for some time in London, Berlin, and Göttingen, Lappenberg was elected in 1820 to the post of resident minister from Hamburg to the Prussian court at Berlin. From 1823 to 1863, he was keeper of the Hamburg archives, and devoted his life to research and writing on English and German history. In 1850 he represented Hamburg in the German Parliament at Frankfurt. His *Geschichte von England* (2 vols., 1834-1837) was continued by various historians. Parts of it were translated into English as *History of England under the Anglo-Saxon Kings* (1845; new ed., 1884) and *History of England under the Norman Kings* (1857). He published many books on the history of Hamburg, among them *Hamburger Rechtsaltertümer* (1845); *Urkundliche Geschichte des Hansischen Stahlhofes zu London* (1851), which is a study of commerce between Great Britain and Germany; and *Hamburgische Chroniken* (1852-1861). He also contributed articles on the Middle Ages to the *Monumenta Germaniae Historica*.

LAPRADE, là-prād', (**Pierre Marin**) **Victor (Richard) de**, French poet and critic: b. Montbrison, France, Jan. 13, 1812; d. Lyon, Dec. 13, 1883. His early verse appeared in four volumes: *Les parfums de la Madeleine* (1839); *La colire de Jésus* (1840); *Psyché* (1841); and *Odes et Poèmes* (1844). While professor of literature at Lyon (1847-1861), he was elected to the French Academy in 1858, the year in which his *Idylles héroïques* was published. Turning to political satire, he wrote *Les Muses d'État*, which cost him his professorship. In 1871 he was elected to the National Assembly, where he sat with the right center. His later publications included *Poèmes civiques* (1874), and *Le livre des adieux* (1878). His collected poems were published in six volumes (1878-1881). His prose writings included *Questions d'art et de morale* (1861); *Le sentiment de la nature avant le christianisme* (1866); *Le sentiment de la nature chez les modernes* (1868); and *Contre la musique* (1880).

LAPRADELLE, là-prà-dèl', **Albert de Geouffre de**, French international jurist: b. Tulle, France, 1871; d. Feb. 2, 1955. Professor of international law at Grenoble, and then at Paris from 1905 to 1939, he was founder and editor of the *Revue de Droit International* and *La Vie des*

Peuples. Among his publications are: *Causes célèbres du droit des gens*, 5 vols. (1929-1937); *Les grands cas de la jurisprudence internationale* (1937-1938); *Le Marxisme tentaculaire* (1942); and *La paix moderne 1899-1945* (1947), a history of the peace movement to the United Nations.

LAPRAIRIE, là-prâr'î, town, Quebec, Canada, capital of Laprairie County on the southern shore of the St. Lawrence River, near the east end of the Lachine Rapids, opposite Montreal. The local industries in a truck gardening district are brick making and fruit canning and freezing. The town is served by the Canadian National Railways.

At its settlement in 1673 as La Prairie de la Madeleine (Magdalen's Meadow) it was fortified by Frontenac. During King William's War (1689-1697) it was twice raided by New York and New England troops. In the late summer of 1690 Capt. John Schuyler with 29 white volunteers and 120 Indians killed and captured 25 inhabitants and destroyed much property. A year later his brother, Maj. Peter Schuyler, mayor of Albany, attacked the town with a force of 266, including 120 whites, the rest Mohawks and Mohegans. Retreating to his canoes on the Richelieu he suffered severe losses in battle.

Canada's first train steamed from Laprairie to St. John's on the Richelieu (15 miles) in 1836. Incorporated 1909. Pop. (1951) 4,058.

LAPSE, legal term with several definitions. In the law of wills lapse is where a beneficiary under the will dies before the testator and the legacy is lost, or fallen and automatically becomes a part of the residuum of the testator's estate, unless provision is made in the will to prevent such lapse. In several States the law provides against total lapses in certain cases, as in the instance of children or grandchildren surviving the legatee, in which case the bequest would go to the heirs by direct descent. There is a distinction between "void" and "lapse," a bequest becoming void when the legatee is dead at the time of the making of the will.

In ecclesiastical law a benefice is adjudged to have lapsed when the patron fails within six months after the avoidance of the benefice to exercise his right of presentment. In such case the rights of patronage devolve upon the bishop as ordinary patron, the metropolitan as superior patron, and the sovereign as patron paramount of all the benefices in the realm.

In English criminal procedure "lapse" is used in the sense of "abate," to indicate that the death of one of the parties involved brought the proceedings to a conclusion.

LAPSED, term applied in the early days of Christianity to those converts who fell away from faith in times of persecution, returning to heathen practices such as idol worship, burning incense or sacrificing to the heathen gods. Excommunication was the punishment accorded such as denied the faith or reverted to heathen practices, and there was vigorous opposition to their being restored to the Church. However, on profession of penitence they were permitted to hope for reinstatement in the Church, but were compelled to pass a long probation and perform special penances, and most often were admitted to communion only at the time of death.

LAPUTA, island described in Swift's 'Gulliver's Travels' as floating in the air guided by a loadstone under the control of the inhabitants. It was peopled by a race of philosophers devoted to mathematics and music, and who let their land run to waste and their people live in penury while they devoted themselves to visionary schemes such as softening marble "for pillows and pin-cushions," extracting "sunbeams from cucumbers" for use in raw weather, and similar absurdities, directed as satire against Sir Isaac Newton and the Royal Society. The philosophers were attended by "flappers" whose duty it was to awaken them from their deep introspection when addressed. Laputa in many respects resembles the "lantern-land" in Rabelais' 'Pantagruel,' Swift being generally believed to have imitated that work.

LAPWING, a plover (*Vanellus vanellus* or *cristatus*), found throughout temperate Europe and Asia, across the whole breadth of which it breeds. It has a hind toe and in this respect departs from the true plovers. In the summer a few are found as far north as Norway, Iceland and Greenland, and in winter they migrate for the most part to Africa and India. In its habits the lapwing much resembles the American killdeer; and, like that bird, it is hated by gunners on account of its alarm-cries. This pursuit and the market demand for its flesh, and more especially for its eggs, greatly reduced its numbers, especially in Great Britain, where it is again on the increase due to its recent protection by law. The lapwing is noteworthy for the long flowing crest on the head, the contrasting white and deep iridescent green of its plumage, and for its peculiar jerking, yet rapid flight. In the breeding season it is always seen in pairs, but in the winter months great flocks are visible on the seashore and on the borders of marshes. Consult Newton, 'Dictionary of Birds' (London 1896), and 'The Lapwing, Green Plover, or Peewit' (in 'Agriculture and Fisheries Board of Great Britain, Leaflet No. 44' 9th ed., ib. 1905).

LAPWORTH, Charles, English scientist: b. Faringdon, Berkshire, 1842; d. 1920. He was trained as a schoolmaster at Culham College, and was master of a school at Galashiels 11 years. All of his leisure time was devoted to geology, and in 1881 he was appointed professor of geology and physiography at Birmingham University, holding the chair until 1913. He did notable work in his geological investigations, especially in the Durness-Eriboll district of Scotland, which he began in 1882, and during the course of which he established his theory of "rock-fold" and interpreted the complicated strata which had baffled previous observers. Among his works are 'The Geological Distribution of the Rhabdophora' (1880); 'Intermediate Text-Book of Geology' (1899); 'British Graptolites' (1900-08), etc.

LARAMIE, Wyo., city and Albany County seat, alt. 7,159 feet, on the Laramie River, and the Union Pacific and the Laramie, North Park and Western railroads, 58m. W. of Cheyenne, the capital. It has an airport. Laramie is a summer resort, as well as the trading and distributing center for a large stockraising and mining section. Aside from the mining of gold,

silver, coal, iron, and petroleum in nearby deposits, and the milling of these and other minerals, Laramie engages in the manufacture of railroad ties, cement, and allied products. It also has oil refineries and stockyards. There is a state stock farm, a state agricultural experimental station, and a United States oil shale experimental station. The city is under the council-manager form of municipal government. It has a public library and a university library which houses a Western historical collection. Laramie is the seat of the University of Wyoming, a coeducational institution founded in 1886, and the city's cultural life centers largely upon it. Other points of interest include a paleontological museum in the university science hall and a museum of pioneer relics in the Albany County Court House. Laramie was first settled in 1868 by employees of the Union Pacific Railroad. The site was on the old Overland Trail and Pony Express route. It was named for Jacques Laramie, pioneer fur trapper and trader, as were the Laramie Mountains, Plains and River. It was in Laramie that Bill Nye, noted humorist and editor of *The Boomerang*, established his "den of 40 liars." Pop. (1940) 10,627; (1950) 15,497.

LARAMIE, river, Colorado, rising in northern Colorado and flowing north into Wyoming where it turns northeast and empties into the North Platte River. It is about 200 miles long.

LARAMIE MOUNTAINS, a Rocky Mountain range which extends through southeastern Wyoming and northern Colorado, and bounds the Laramie Plains on the east. The highest point is Laramie Peak, 9,020 feet high. Coal is the principal mineral, and is found in the foothills of the range and there are vast deposits of iron ore.

LARAMIE STAGE or **GROUP**, geological formation of western North America consisting of several thousand feet of nonmarine sediments. There has been considerable controversy as to the true geological age of the strata, and it is now assumed to belong to the Cretaceous period—the latest period of the Mesozoic era—and not to the early periods of the Cenozoic era as was formerly believed. The beds are characterized by many Upper Cretaceous land plants and Cretaceous dinosaur fossils but no marine sediments are present. The Laramie group varies in depth from very thick deposits in Colorado, Wyoming, and the Great Plains region of Alberta to thinner deposits eastward toward the Dakotas.

LARAT, island, Republic of Indonesia, one of the Tanimbar Islands, in the Malay Archipelago. It is 20 miles long and seven miles wide. Pop. (1940) 3,703.

LARBAUD, lâr-bô', Valéry, French author: b. Vichy, Aug. 29, 1881. He is best known for his *A. O. Barnabooth, Poésies et Journal Intime* (1913), a novel concerning the vain efforts of a South American millionaire to assimilate the pleasures of European society.

His other works include *Fermina Marquez* (1911); *Enfantine* (1918); *Jaune, Bleu, Blanc* (1927); and *Domaine Anglais* (1937).

LARBOARD, left side of a ship looking toward the bow, a term probably derived from

its usually being the lading or loading side. The word is now obsolete, its similarity to its opposite "starboard" having caused it to be superseded by the word "port."

LARCENY, the fraudulent appropriation of the personal property of another person without that person's consent and with intent to deprive him of permanent possession of his property. To constitute this crime the removal of the goods to any distance is not necessary, but it requires to be shown that the article has completely passed, for however short a time, into possession of the criminal. Concerning the kinds of things the appropriation of which is larceny, the common law restricted them to personal property as distinguished from real estate, but this distinction has been largely abolished by recent statutes. At one time in Great Britain the punishment for grand larceny was death but now the punishment for larceny is imprisonment, the same as in the United States, and depends on the previous character of the prisoner. The common law rules on larceny have been greatly modified by statute and the conversion of goods to one's own use with felonious intent, as in the embezzlement of funds which have been confided to one, is now defined and punished as larceny. The obtaining of property under false pretenses is another offense which has been consolidated with larceny in some state jurisdictions.

As indicated above there are two forms of common law larceny—by asportation involving the trespass and carrying away of another person's personal property, and by trick or device which occurs when a person obtains possession of personal property fraudulently with intent to secure the property for himself.

Although the distinction between grand and petit, or petty larceny still exists as it pertains to the penalty, the jurisdiction of the courts, and so forth, the distinguishing features vary considerably from state to state. In New York State, for example, grand larceny in the first degree is defined as such and in general it involves a theft of \$500 or more with a maximum penalty of 10 years' imprisonment. Grand larceny in the second degree generally involves the theft of \$50 or more with a maximum of 5 years. Petit larceny is a misdemeanor involving lesser amounts with a maximum of one year. In the State of Michigan there are no such statutory distinctions, although the penalty is determined along similar lines. Each state jurisdiction must be consulted. See **THEFT**.

LARCH, river, northern Quebec, Canada. It flows northeast to join the Kaniapiskau River, forming the Koksoak River. With its longest headstream it is about 300 miles long.

LARCH, a genus (*Larix*) of deciduous conifers characterized by pyramidal growth; small linear leaves arranged in clusters upon the older branches, singly and spirally upon the young twigs; often conspicuous pistillate flowers which develop small, erect, globose or oblong cones, the attenuate scales of which are not deciduous at maturity. The species, of which there are about a dozen, are natives of the colder parts of the Northern Hemisphere. The best-known one in North America is the American larch, hackmatack or tamarack (*L. laricina*), which grows generally in wet, peaty soils and shallow swamps, or occa-

sionally upon drier upland soils, from Hudson Bay to Pennsylvania, and westward to Manitoba and Illinois. It attains a height of 60 or more feet, and has nearly horizontal branches. Its wood is hard and very durable, but light in proportion to its size. Being very straight and slowly tapering, the trunks are much used for telegraph poles, scaffold supports, fence posts, railway ties and in shipbuilding. It is less planted for ornamental purposes than the following species because its branches are less pendulous and less leafy.

American larch: twig and fruit (cones).

The European larch (*L. decidua*) grows usually upon dry uplands and a wide range of soils, but rarely in moist ground. Its range is from the mountains of southern Europe to the far north, where it is among the few hardy trees. In height it often reaches 100 feet, and because it is of rapid growth, it is used for an even larger number of purposes than the preceding. It is often planted for commercial purposes, for windbreaks, and for ornament. The timber which is rich in resin and is practically exempt from insect attacks is valuable for wet locations. It is little used for planks because it warps badly. Since it does not ignite readily and does not splinter it was formerly used in wooden battleships. Its bark, which contains tannin, is somewhat used in preparing leather; its stem yields Orenburgh gum resembling gum arabic; and its leaves in warm climates exude Brançon manna, a sweetish, turpentine-flavored manna (q.v.).

Of the other species, one of the most beautiful and ornamental is *L. leptolepis*, a native of Japan. It grows 70 to 80 feet tall, and its foliage is brilliantly colored in autumn. The timber of the light close-grained western larch, *L. occidentalis*, a native of the Pacific Coast region from Oregon northward, is considered the best yielded by coniferous trees. The tree is the largest of the genus, often reaching a height of 150 feet.

The golden larch, *Pseudolarix amabilis*, also deciduous, with larger cones which fall apart at maturity is an even more beautiful tree by reason of its more feathery appearance and light yellow-green leaves which turn bright golden-yellow in autumn.

The only insect seriously harmful to the larch is a sawfly (*Pristiphora erichsoni*), whose young hatch in early summer from eggs previously inserted into the young shoots, and immediately begin feeding upon the leaves. This pest is occasionally sufficiently numerous to defoliate large tracts of forest.

LARCH SAWFLY, insect pest (*Pristiphora erichsoni*), whose whitish larvae feed upon the foliage of larch trees. The pest exists in Canada, United States and England and is very destructive, entire forests being defoliated.

LARCHMONT, village, N. Y., located in

Westchester County; at an altitude of 100 feet on Long Island Sound; about 20 miles northeast of New York City; on the New York, New Haven, and Hartford Railroad. A residential suburb, with no industries, it is the home of the well-known Larchmont Yacht Club. It is governed by a mayor and council. Larchmont was founded in 1661 and incorporated as a village in 1891. Pop. (1940) 5,970; (1950) 6,293.

LARCOM, Lucy, American author and educator: b. Beverly, Mass., Mar. 5, 1824; d. Boston, April 17, 1893. As a young girl she was a mill-worker in Lowell, Mass. (1835-1846), and about 1840 she began contributing to the *Operative's Magazine* which merged with the *Lowell Offering* two years later. Her contributions attracted the attention of John Greenleaf Whittier whom she later assisted with the preparation of his verse anthologies entitled *Child Life* (1871) and *Songs of Three Centuries* (1883). In 1846 she went to Illinois to teach school in pioneer communities and at Monticello Seminary near Alton, Ill., where she also studied (1849-1852). She spent eight years, from 1854 to 1862, as a teacher at Wheaton Seminary (later Wheaton College) in Norton, Mass. In 1865 she became an editor of *Our Young Folks*, a Boston magazine later merged with *Saint Nicholas*. Her last years were spent in Beverly and Boston. Miss Larcom's most effective writing was achieved in her poems of New England life, perhaps the best known being *Hannah Binding Shoes*. Among her works are *Poems* (1869); the autobiographical *A New England Girlhood* (1889); and *The Unseen Friend* (1892). In the last, published a year before her death, she gave the final expression of her religious faith.

LARD, the melted and strained fat of hogs. The finer grades of commercial lard are taken from the abdominal part of the animal, "leaf lard," taken from the fat surrounding the kidneys, being considered the best. Lard is rather soft and white and melts readily at 35°-45°C. It consists of stearin, the solid residue, olein, a liquid fat or lard oil removed by pressure, and palmitin. Stearin is used to stiffen soft lards and those shipped to warm climates. Olein is used for burning and as a lubricant. Lard itself is used in the production of margarine and as a base for ointments. Great quantities are produced in the United States, especially in the Chicago area, and much of it is exported. See also **FATS**; **MEAT**—*Meats and Meat Production*.

LARDNER, lărd'nēr, Dionysius, Irish physicist, mathematician, and writer on science: b. Dublin, April 3, 1793; d. Naples, April 29, 1859. He received his M.A. from the University of Dublin in 1819 and became professor of astronomy and physics at the University of London in 1828. He wrote two notable mathematical treatises entitled *A Treatise on Algebraical Geometry* (1823) and *On the Differential and Integral Calculus* (1825). He is best known for his *Cabinet Cyclopaedia*, a 134-volume reference work which he edited from 1829 to 1844. He himself wrote articles on hydrostatics, pneumatics, and mathematics for the *Cyclopaedia*. Because of a scandal in 1840 he lost his chair at the University of London and began a self-imposed exile which lasted until his death in Naples almost 20 years later. His other work includes *Treatise on Heat* (1844); *The*

Steam Engine (1852); *Natural Philosophy and Astronomy* (1851-1852).

LARDNER, Ring, in full RINGGOLD WILMER LARDNER, American author: b. Niles, Mich., March 6, 1885; d. East Hampton, N. Y., Sept. 25, 1933. He was graduated from high school in Niles and briefly attended Armour Institute of Technology in Chicago, Ill. After working at varied occupations, in 1905 he became a reporter on the South Bend (Ind.) *Times*. Moving to Chicago, he spent nearly 15 years as writer for several local newspapers, including the *Inter-Ocean*, *Examiner*, and *Tribune*, and for a short time was editor of *Sporting News*, a baseball weekly, in St. Louis, Mo. His special field was sports, and he traveled around the country for many years as feature writer for professional baseball. In 1914 he began writing short stories about baseball players, printed in *The Saturday Evening Post*, and later collected under the title *You Know Me, Al* (1915). In 1917 he published some further satires about the newly rich, as *Gullible's Travels*. During the next 10 years he wrote several series of short pieces: *Own Your Own Home* (1917); *Treat 'Em Rough* (1918); *The Real Dope* (1918); *My Four Weeks in France* (1918); *The Young Immigrants* (1919); *How to Write Short Stories* (1924); *What of It?* (1925); and *The Love Nest* (1926). In 1927 he published an autobiography, *The Story of a Wonder Man*. He was also co-author of two very successful plays: *Elmer the Great* (with George M. Cohan, 1928) and *June Moon* (with George S. Kaufman, 1929).

While Lardner is thought of primarily as one of the major American humorists, critics have pointed out that his satire is caustic, picturing a great many people as unhappy, shabby exhibitionists. His stories are read, however, for the shining humor and the excellent character delineation of the lower middle class. Among his most familiar stories are *Haircut*, *Champion*, *The Love Nest*, *Golden Honeymoon*, and *Some Like Them Cold*. Although they may be found in innumerable anthologies, a useful collection is *The Portable Ring Lardner* (New York 1946).

LAREDO, là-rā'dō, city, Texas, port of entry, and Webb County seat; altitude 438 feet; on the Rio Grande, opposite Nuevo Laredo in Mexico; 161 miles west of Corpus Christi, and 154 miles southwest of San Antonio; on the Missouri Pacific, and Texas Mexican railroads, connecting at Nuevo Laredo with the National Railways of Mexico. The city is a terminal of the Pan American Highway, and has an airport with international and transcontinental service. International Bridge to Nuevo Laredo is south of the city, and over it pass thousands of tourists each year. Onions and grapefruit are important crops of the adjacent irrigated farm lands. Cannel coal, natural gas, and petroleum are produced here. The city has large railroad shops, oil refineries, antimony smelter, and manufactures of harvest hats, tile, brooms, and clothing. The chief port on the Mexican border, Laredo clears an export trade of over \$100,000,000 annually for the Republic of Mexico, and 54 per cent of the entire overland imports and exports between the United States and Mexico pass through the city. Laredo was established in 1755 by Spanish settlers, one of the first Texas towns not founded as a mission or presidio.

During the Mexican War it was occupied by Texas Rangers in 1846, and by the forces of Gen. Mirabeau Lamar (q.v.) in 1847. On July 13, 1847, the first free election in the town under the laws of Texas was held by proclamation of General Lamar. In 1849 Camp Crawford, now Fort McIntosh, was built by the United States government at a ford of the Rio Grande used by smugglers. During the Civil War the fort was held by Confederate troops. The city was chartered in 1852. Government is by a mayor and a council. Pop. (1940) 39,274; (1950) 51,910.

LARES, Amador de, the contador or royal treasurer of the island of Cuba at the time when Diego de Velázquez was governor, that is, in the first quarter of the 16th century. He is remembered for the aid he gave Hernando Cortés in securing and retaining the command of the expedition fitted out for the conquest of Mexico in 1518-1519.

LARES, là-rêz, plural of the Latin word *lar*, tutelary divinities of the Romans, originally either the spirits of ancestors who watched over the family of a descendant, or, according to a perhaps more probable view, gods of the lands on which the man's house stood, and later household gods. See also **LARS**.

LARGILLIERE, làr-zhê-lyâr, or **LARGILLIERRE, Nicolas de**, French portrait painter: b. Paris, Oct. 20, 1656; d. there, March 20, 1746. He studied at Antwerp under Antoine Goubeau and at 18 went to England where for four years he worked under Sir Peter Lely. His work attracted the favor of Charles II, but alarmed by the feeling against Catholics engendered by the Rye House Plot (q.v.) he went to Paris to live in 1678. There he made the acquaintance of the artists Charles Le Brun and Antoine-Francois Van der Meulen, and soon became known as a portrait painter. He returned to London at the invitation of James II and painted portraits of the king and queen and members of the court. After his return to Paris he became a member of the Academy, in 1686 his diploma picture being the portrait of Le Brun now in the Louvre. He was made chancellor of the Academy in 1743.

His sitters included some of the greatest celebrities of his day, Pierre-Daniel Huet, bishop of Avranches, Cardinal Louis-Antoine de Noailles, Lambert de Thorigny being among them. While he occasionally painted other subjects, his fame rests upon his portraits, including those of single sitters and large groups. His work is represented in the leading European galleries, and was widely known through the engravings of Louis Desplaces, Pierre Drevet, Gerard Edelinck, and others. His portrait of Mme. de Thorigny is in the Metropolitan Museum of Art in New York City.

LARGO, làr'gō, musical term from the Italian designating a slow tempo, largely used to indicate a slow, broad, solemn style. George Frederick Handel often employs it, as in the *Messiah* and *Behold the Lamb of God*. Franz Joseph Haydn used it in the introduction, the first chorus and in the introduction to the third part of the *Creation*. Beethoven used it to convey only grandeur and deepest feeling. Style, not pace, is its dominating characteristic. The term "largamento" indicates breadth of style without change of tempo.

LARGS, lărgz, seaport burgh, Scotland, in Ayr County, on the Firth of Clyde, 29 miles west-southwest of Glasgow on the national railroad. It has yachting facilities. The mausoleum, Skelmorlie Aisle (1636), is a relic of the old parish church. The Battle of Largs was fought between Haakon IV Haakanson of Norway and Alexander III of Scotland in 1263. Pop. (1951) 8,606.

LARI, lă'ri, a suborder of birds of the order Charadriiformes. It comprises the gulls and terns (Laridae), skimmers (Rynchopidae), and skuas and jaegers (Stercorariidae). They are birds of buoyant, graceful flight, and have long, pointed wings. Their numbers include birds adapted to every part of the globe where there is open water.

LARIAT. See LASSO.

LARIDAE. See LARI; GULLS; TERN.

LA RIEGE, France. See ARIEGE.

LARIIDAE, lă-rî'i-dē, a family of seed-infesting beetles also designated as Bruchidae and Mylabridae. They are small, robust, short-bodied insects, and are erroneously referred to as weevils, which they resemble somewhat in having the head produced to resemble a snout. The body is clothed with small scalelike hairs. The elytra are short, exposing a part of the abdomen. The very small eggs are glued on the pods or seeds or within the burrows of the larvae and adults. The larvae undergo a hypermetamorphosis in which the first stage upon hatching has well-developed legs; they are able to move freely, and are capable of eating their way into both immature and hard, fully developed beans, peas, and seeds of other legumes. The life histories are often complex, there being one or many broods. The common pea weevil is a good example. The eggs are deposited on the outsides of the green developing pods, and each larva, upon hatching, burrows through the pods and enters a single green pea. In contrast, the many species of bean and other weevils not only infest the ripening seeds in the field but also continue to breed and feed in them generation after generation in storage until nothing but chaff remains. The complete life cycle of these beetles is from 20 to 80 days.

EDWARD O. ESSIG.

LARIOSAUROS, lăr-ē-ō-sô'rūs, a genus of fossil reptiles, of the family Nothosauridae, allied to the plesiosaurs. They were lizardlike in shape, rarely a yard long, and had heads of moderate size with many prehensile teeth. Nearly complete skeletons have been obtained from the black Triassic shales near Lake Como.

LARISSA, lă-ris'ă, city, Greece, capital of the department of the same name in Thessaly, on the Salambria River, 35 miles northwest of Volos, with which it connects by railway. Located in a rich agricultural district, it is the seat of a Greek archbishopric and has various industries. For centuries under Turkish rule, it was restored to Greece by the annexation of Thessaly in 1881. It was headquarters of army mobilization in the Balkan Wars of 1912-1913, and saw severe fighting between Greek and British forces against German. Pop. (1951) 41,163.

LARIVEY, lă-rē-vă', Pierre de (originally surnamed GIUNTA), French dramatist: b. Champagne about 1540; d. Troyes, France, Feb. 12, 1619. Son of a Florentine merchant, he became a canon of the Church of St. Etienne at Troyes. His first six plays (*le Laquais, la Veuve, les Esprits, le Morfondu, les Jaloux, les Ecoliers*), published in 1579, were adaptations of Italian comedies, which, though changing locales and names of characters, retained the type characters of the *Commedia dell'arte*. The last three (*la Constance, le Fidèle, les Tromperies*) were published in 1611. Larivey's plays were in prose, a novelty in that period. Although never performed, they influenced J. F. Regnard and Molière. Larivey also translated works of Giovanni Straparola and Guido Aretino.

LARK, a songbird of the family Alaudidae, numbering some 75 species, all but one of which are confined to the Old World. The horned lark (*Eremophila alpestris*) reached America from Asia and is now widespread. All larks frequent open fields, prairies, or deserts. The long-billed lark (*Alaemon*) inhabits barren deserts in India where there is not a blade of grass to protect it from the tropical sun. Most larks sing while hovering high above the ground on quivering wings. The most famous of such ecstatic songsters is, of course, the skylark (*Alauda arvensis*) of Europe. Efforts to introduce this bird into America failed, but it is established in Hawaii and New Zealand. Larks build a cuplike nest; the eggs are spotted. They can run rapidly. The toes and claws are very long, presumably to give them added traction when traversing snow or loose sand. Larks have a rather stout bill, adapted for eating seeds and other vegetable matter. Many insects are also devoured during the summer. Most larks are protectively colored to match the soil or grass, for they must rely upon protective coloration, as a rule, to evade enemies. Larks living upon deserts with reddish sands are reddish in color; those living on black soils are blackish, and so forth. Among the few that are not protectively colored is the large black lark (*Melanocorypha yeltoniensis*) of the steppes of central Asia. The curious little sparrow larks of Africa and India (*Eremopterix*) have a very thick bill and are prominently marked on the head and underparts with black. They look not unlike the male of the house sparrow (*Passer domesticus*). Despite their small size larks are considered a table delicacy in southern Europe. They are captured in nets during migration and sold in the markets of the cities.

DEAN AMADON.

LARK BUNTING (*Calamospiza melanocorys*), a bird of the finch tribe inhabiting the plains of central North America. The male is black with conspicuous white patches on the wings; the female is streaked with brown and gray. In winter the male, too, molts into an inconspicuous plumage. Like the lark and other birds of grassy plains, where there are no elevated singing perches, this finch has learned to sing while fluttering in the air—hence the name "lark" bunting.

LARK SPARROW (*Chondestes grammacus*), one of the larger and more attractive of the American sparrows. It frequents areas of grass and scattered bushes. The food is seeds and

insects, especially grasshoppers. The lark sparrow has a boldly streaked head and a rounded, white-tipped tail. The melodious song is like a series of chants.

LARKIN, James, Irish labor leader; b. Manchester, England, 1877?; d. Dublin, Jan. 30, 1947. He organized the Irish Transport and General Workers' Union. He was prominent in several strikes, notably that of the Irish Transport Workers' Union, which was attended by violence and sabotage. Larkin was sentenced to seven months' imprisonment for sedition but was released on bail. He edited the *Irish Worker* and came to the United States in 1914 to raise funds for the Irish fight against Britain. One of the founders of the Communist Party in the United States, he was imprisoned there for criminal anarchy, later pardoned, and deported to Ireland in 1923. He organized the Irish Workers' Union, served on the Dublin Municipal Council and, following 1937, in the Dail Eireann.

LARKSPURS, a genus (*Delphinium*) of annual and perennial herbs of the family Ranunculaceae, characterized by palmately lobed or divided leaves and showy racemes or panicles of large irregular flowers. Many of the species, of which there are over 250 in the north temperate zone, are cultivated for ornament. Many improved varieties and hybrids have been developed, some double-flowered. In horticultural practice the annual species are called larkspurs, the perennial ones delphiniums. The most popular annual species is *D. ajacis* which grows one to four feet tall and bears showy blue, pink, violet, or white flowers throughout the summer. Of the perennial species *D. cheilanthum*, *D. elatum* and *D. grandiflorum* are most popular in America and have yielded the largest number of horticultural varieties.

They are all native to Asia. They blossom during midsummer and are noted for their beautiful tints of blue, their hardiness and ease of cultivation. If cut down immediately after flowering they often blossom a second time before frost. Among the best-known American species are *D. Mensiesii*, *D. scopulorum* and *D. nudicaule*, which range from the Pacific Coast to the plains region. *D. tricornis* and *D. carolinianum* are found most commonly east of the Mississippi. The larkspurs thrive best in rich, deep sandy loam, well exposed to the sun. The annuals are propagated by seed, as are many of the perennials which are also increased by root division in autumn or early spring or from second growth in summer. Seeds are usually sown in autumn out of doors or early winter in a greenhouse.

LARKSVILLE, borough, Pennsylvania, in Luzerne County; altitude 940 feet; on the Susquehanna River; 3 miles northwest of Wilkes-Barre. It is a coal-mining center; named for Peggy Lark, centenarian, who once owned the site. Pop. (1930) 9,322; (1940) 8,467; (1950) 6,276.

LARMINIE, William, Irish poet: b. County Mayo, 1849; d. Bray, Jan. 19, 1900. He spent most of his life in the civil service, ill-health compelling his retirement a few years before his death. He was identified with the Irish Literary Revival and was strongly influenced by the Gaelic legends. His dramatic poem *Moytura* ranks among his best

work. He was author of *Glauha and Other Poems* (1889); *Fand and Other Poems* (1892) and published a collection of *West Irish Folk Tales* (1893). A selection of his verse is given in S. Brooke and T. W. Rolleston's *Treasury of Irish Verse*, accompanied by an appreciation by George Russell (A. E.).

LARMOR, Sir Joseph, British physicist: b. Magherall, County Antrim, Ireland, July 11, 1857; d. Holywood, County Down, May 19, 1942. He was educated at Queen's College, Belfast, and Saint John's College, Cambridge. He was professor of natural philosophy at Queen's College, Galway, and at the Queen's University in Ireland in 1880-1885; examiner in mathematics and natural philosophy in the University of London, and lecturer in mathematics at Cambridge University in 1885-1903. He was knighted in 1909 and after 1911 served as member of Parliament from Cambridge University. He was a member and officer of many scientific societies, and in 1915 received the Royal Society's Royal Medal. He published numerous articles on mathematics and physics, and was author of *Aether and Matter* (1900).

LARNACA, or **LARNAKA**, or **LAR-INCA**, city, Cyprus, at the head of a bay on the south coast, 23 miles southeast from Nicosia. It is the chief seaport of the island and is built on the site of the ancient Citium. It has Phoenician inscriptions, Mycenaean tombs and other antiquities, but the ancient citadel was leveled in 1879. The Greek church of St. Lazarus is an ancient Byzantine structure still well preserved. A Phoenician town before it fell to the Greeks, Citium is identified by some scholars with the Old Testament Chittim. A cuneiform inscription found here indicates that its king was a tributary of the Assyrian King Sargon in 709 B.C. An annual fair at Larnaca called *kataklysmos* (the Deluge) traditionally commemorates the birth of Aphrodite. Exports include grain, fruit, raisins, gypsum, umber, asbestos and cotton. Pop. (1946) 14,746.

LARNE, seaport, Ireland, a city of County Antrim, on Lough Lorne, an inlet of the North Channel, 26 miles north of Belfast, on the Belfast and Northern Counties Railroad. Larne's situation, 30 miles from the Scottish coast, makes it a base of the shortest passage from Ireland to Great Britain, and there is a daily mail service. It is a market town and seaside resort, ships iron ore, and there are a bleaching establishment, flour mills and a weaving factory. Pop. 11,090.

LARNED, Josephus Nelson, American author and librarian: b. Chatham, Ontario, Canada, May 11, 1836; d. Buffalo, N. Y., Aug. 15, 1913. He was a member of the editorial staff of the *Buffalo Express* 1859-1869, and editor, 1869-1872; he was then superintendent of public education in Buffalo for a year, and in 1877 became librarian of the Buffalo Library, a position which he held for 20 years. He was president of the American Library Association in 1893-1894. He edited and published (1902) *The Literature of American History*, a bibliography, in which the "scope and comparative worth" of each book is indicated in short annotations by historical students. His other works include *Talks about Labor* (1877); *History for Ready Reference* (7

vols., 1895-1910; including 5 vols., 1894-1895, and two supplements, 1901 and 1910), an historical dictionary consisting mainly of quotations from leading authorities, which was revised and reissued as *The New Larned History* (12 vols., 1922-1924); *Seventy Centuries: a Survey* (1905); and *Books, Culture and Character* (1906).

LARNED, lăr'nĕd, city, Kansas; seat of Pawnee County; altitude 2,025 feet. It is situated at the junction of the Pawnee and Arkansas rivers, 63 miles west of Hutchinson, and is served by the Missouri Pacific and the Atchison, Topeka and Santa Fe railroads. It is the shipping center of a grain, stock, and dairy farming area, growing wheat, alfalfa and sugar beets. It has flour mills and cheese factories, and ships sandstone. The city is on the old Santa Fe Trail, and near by is the site of old Fort Larned, established in 1859 to protect travelers from Indian attacks, but abandoned in 1878. Pawnee Rock, scene of many battles between Indians and white men, is near Larned. The city was settled in 1872 and incorporated in 1886. Pop. (1950) 4,447.

LAROMIGUIERE, là-rô-mĕ-gyâr', Pierre, French philosopher: b. Livignac, Aveyron, Nov. 3, 1756; d. Paris, Aug. 12, 1837. He studied under Étienne Bonnot de Condillac, and became professor of philosophy at Toulouse, but being censured by its Parliament for his publication of a treatise on taxation, he went to Paris, where he was favorably received. He was appointed professor of logic in the École Normale and lecturer at the Prytanée, and in 1811 professor of the faculty of letters in the University of Paris. He was a member of the Tribunate in 1799. In 1833 he was elected a member of the Academy of Moral and Political Sciences.

Laromiguière's theories as a philosopher led him to distinguish clearly between the psychologic phenomena which may be traced to physical causes and the action of the soul itself, and he developed the theory of attention beyond even his master, Condillac, and others who influenced his views, A. L. C. Destutt de Tracy and P. J. G. Cabanis among them. He maintained that the soul is free in its choice and therefore immortal. While not distinctively an originator, but rather a developer of philosophic theory, he possessed a faculty for clear and accurate statement so that his work crystallizes not only the results of his own observations but those of others who influenced his thought. He was the author of *Projet d'éléments de métaphysique* (1793); *Sur les paradoxes de Condillac* (1805); *Leçons de philosophie* (1815-1818).

LAROUSSE, là-rôôs', Pierre Athanase, French lexicographer and encyclopedist: b. Toucy, Yonne, Oct. 23, 1817; d. Paris, Jan. 3, 1875. He was the son of a village blacksmith, became a teacher, and for many years compiled textbooks for elementary schools. In 1859 he founded *L'école normale*, a periodical for teachers. In 1865 appeared the first volume of his great library of information, anticlerical in tone, *Grand Dictionnaire universel du XIX^e siècle*, a dictionary and encyclopedia combined. It was in 15 volumes and was completed in 1876 after his death; supplements in 1878 and 1884. A new edition, *Nouveau Larousse illustré*, under the supervision of Claude Augé, was published in 1897-1904; supplement in 1907. The *Larousse*

du XX^e siècle, under the supervision of Paul Augé, appeared in six volumes in 1928-1933. The original aim of Pierre Larousse was to be entertaining and bright in his articles, rather than scholarly, critical and exact. The succeeding versions of his work have been profusely illustrated, especially as regards the fine arts. Larousse's small *Dictionnaire de la langue française* (1856) was continued by Claude Augé as an encyclopedic dictionary in one volume, renamed the *Petit Larousse illustré* (1906) and the *Nouveau Petit Larousse illustré* (1924).

LARRA, lăr'ră, Luis Mariano de (surname in full, LARRA Y WETORET), Spanish writer: b. Madrid, Dec. 17, 1830; d. there, Feb. 20, 1901. He was the son of Mariano José de Larra. He entered the offices of the *Gaceta de Madrid* at the age of 17, and became editor (1856-1866). Larra filled many public offices and was decorated by several of the governments of Europe for brilliant literary work and advocacy of governmental and other reforms. He was for a number of years director of the *Boletín oficial* of the ministry of internal affairs.

Larra was the author of a vast quantity of verse, short stories, and critical articles. Among his formal published works are several novels; the plays *El amor y la moda*, *El amor y el interés*, *El rey del mundo*, *La oración de la tarde*, *Flores y perlas*, *Oros, copas, espadas y bastos*, *Las corazonas de oro*, *Un buen hombre*; and the zarzuelas (operettas) *Las hijas de Eva*, *La conquista de Madrid*, *Cadenas de oro*, *Los hijos de la costa*, *Sueños de oro*, *La vuelta al mundo*, *Chorizos y polacos*, and *El guerrillero*, among many others.

The work of Larra is generally interesting, and brilliant in spots; but he wrote too rapidly to produce much of the highest order. His dramas and zarzuelas have been long very popular in Spain and in the Latin American countries where they have been presented by the best companies. Among the composers who furnished the music for his zarzuelas are Francisco Barbieri, José Rogel, Pascual Arrieta y Corera, Manuel Fernández Caballero, Joaquín Gaztambide, and Pedro Miguel Marqués.

LARRA, Mariano José de (surname in full, LARRA Y SÁNCHEZ DE CASTRO; pseudonym FIGARO), Spanish writer: b. Madrid, March 24, 1809; d. there, Feb. 13, 1837. His father, a Spanish medical officer in the French Army, was exiled from 1813 to 1818, and the son was educated at Bordeaux; later at the universities of Madrid and Valladolid. At the age of 13 he had translated parts of the *Iliad* from French to Spanish and had written a grammar of the Spanish language. After abandoning several vocations, he finally drifted into journalism and literature, to which he brought a peculiarly French point of view in his satires.

Larra wrote under a number of *noms de plume*, one of which, "Figaro," he soon made famous. His first popularity was won in a weekly publication entitled *El pobrecito hablador*, in which he burlesqued very cleverly the abuses, habits, and customs of the Madrid of his day. On the arrival of a more liberal policy toward the press on the death of Ferdinand VII, in 1833, he began to take a very active part in politics in which he soon became a noted journalistic contender, satirizing with great cleverness the follies and absurdities of his time. Witty in the extreme, he

never descended to the bitterness of the political, party and personal vituperation of the writers of his day. All the world laughed with him and appreciated the truth of the pictures he painted and the humor of the situations, characters and incidents he depicted, in the best, most fluent and most happy of language which was in general devoid of partisanship and inspired with a spirit of fairness. This fairness of mind and broadness of view increased his popularity and extended the field of his readers. He also acquired a reputation as literary and dramatic critic inferior to that of no other contemporary writer in Spain. At the height of his fame he visited England, France and Portugal and everywhere he was received as a personage of the highest distinction (1835). The following year he visited Belgium and Germany, during which he was elected, in his absence, diputado to the Cortes.

Larra's family relations were unhappy, probably on account of his own lack of domestic qualities; and these were intensified by his relations for several years with a married woman with whom he appears to have been infatuated. Jealousy made his life miserable both at home and in his irregular marital relations, the latter of which becoming unbearable to the woman in the case, she turned her back on the poet; and Larra, in desperation, took his own life. So great was his popularity that "all Madrid turned out to his funeral." Among Larra's published works are 'El dogma de los hombres libres' (translation); the following dramas, translated or adapted, 'Julia'; 'Una imprudencia'; 'Don Juan of Austria'; 'Felipe'; 'Roberto Dillon'; 'Siempre'; 'Tu amor o la muerte'; 'Partir á tiempo'; 'Un desafío'; 'Un rapto' (opera); 'El retrato de Shakespeare.' His original drama, 'El conde de Fernan Gonzalez,' met with some success. A complete edition of Larra's works was published by Montaner and Simon, Barcelona.

LARRABEE, lăr'ra-bē, William Clark, American Methodist Episcopal clergyman and educator: b. Cape Elizabeth, Me., 1802; d. 1859. He was principal of Methodist academies at Cazenovia, N. Y. (1831-35), and Kent's Hill, Me., and in 1837 was a member of the Maine Geological Survey. In 1840 he was appointed professor of mathematics and natural science in Indiana Asbury (now De Pauw) University, and in 1852-54 and 1856 was superintendent of public instruction in Indiana. He worked efficiently toward the improvement of educational methods in his denomination. Among the works published by him are 'Scientific Evidences of Natural and Revealed Religion' (1850); 'Wesley and his Co-laborers' (1851); 'Asbury and his Co-laborers' (1853); and 'Rosabower' (1854), a collection of articles written for the *Ladies' Repository*.

LARRAMENDI, lăr'ra-mēn'dē, Manuel de, Spanish Jesuit scholar: b. Andoain, about 1690; d. Loyola, about 1750. He was educated at Bilbao and was professor of theology at Valencia, Valladolid and Salamanca. After serving for some years at court as father confessor to the queen dowager, Maria Anna, he, in 1733 retired and devoted himself to study and writing. Author of 'De la antigüedad y universalidad del vascuence en Espana' (1728); 'El

imposible vencido; arte de la lengua vascu-gada' (1729); 'Discurso histórico sobre la antiqua y hermosa cantabria' (1736); 'Diccionario trilingüe, castellano, vascuence y latino' (1745).

LARREY, lăr'rā, Dominique Jean, BARON, French military surgeon: b. Baudéan, near Bagnères-de-Bigorre, July 1766; d. Lyons, 1842. He studied medicine at the hospitals Hôtel Dieu and Hôtel des Invalides, and visited America before entering the French army in 1793 as surgeon in the German and Spanish campaigns. He was with Napoleon in Italy and again in Egypt, was created a baron and pensioned in 1810. He continued in service and in 1842 was inspector of military hospitals in Algeria. Larrey originated the *ambulance volante* and was noted for his humanity as well as possessing a high scientific reputation. He became known as 'la Providence du Soldat.' Author of 'Mémoires chirurgie militaire et campagnes' (4 vols., 1812-17); 'Relation des voyages et des campagnes de 1815 à 1840' (1840); 'Clinique chirurgicale' (5 vols., 1830-36); 'Recueil de mémoires de chirurgie' (1821), etc. He was also author of many important scientific papers.

LARS, lărz, Roman tutelary deities. Lars is an Anglicized plural, derived from the Latin, Lar, singular of *Lares* (pron. la-raz). Lares occurs on old Italian monuments beside Lars, an older form of the same word. Attempts have been made to identify Lares or its singular Lar with an Etruscan word, Lar, Larth, Larthi or Larthia, common on sepulchral inscriptions, equivalent to the English "lord" or "lady," "king" or "hero"; and possibly akin to another Tyrrhenian word Laran, name of the Etruscan god of war. But this attempt has not met with general favor. In Döllinger's opinion the Lares were deified ancestors, or souls of men, personifying the vital powers, and so assure the duration of a family, over whom their protection was supposed to extend. Wissowa, on the contrary, holds the Lares to have been originally protecting spirits of lots of arable land, above which rose shrines at those spots (*compita*) where the paths bounding such lands met those of another's holding. Wissowa rejects therefore the older idea of deified progenitors. Holding, as he does, that the Lares were originally gods of the cultivated fields, thence he derived them, claiming that from such agrarian status they later appeared within the Roman home.

Some, looking upon the Lares as earthly beings, discern a distinction thus between them and the Manes on one hand, and between them and the Penates on another. Such as perceive this distinction regard the Manes as infernal spirits; and say the Romans regarded the Penates as heavenly. Yet all authorities agree that Manes, Penates and Lares were regarded as guardian spirits by those who worshipped them.

From very early times a distinction existed between private and public Lares. The Lares domestici (private Lares of the home) were worshipped by the Roman household, and by the family alone. One of those household gods, the Lares familiares, who accompanied the family whenever the residence was changed, was conceived of as the very centre of the household cultus. One view regards the Lares do-

mestici as souls of virtuous ancestors, who (according to the Roman idea) were set free from the realm of shadows by Acherontic rites; exalted into deities; which thereupon became protectors over their progeny, as household gods.

The *Lars publici* (public lars), enjoyed a wider sphere worship, and received particular names from the place over which their influence was supposed by the Romans to extend. Among these may be mentioned (1) *Lares compitales* originally two in number, the mythic sons of *Mercurius* and *Lara* (or *Larunda*), guardian spirits of the cross-roads, where their shrines were erected, and in whose honor an annual festival, the *Compitalia* or the *Laralia* was held, the celebration itself falling in the month of December, a short time after the observance of the *Saturnalia*. It was not alone the cross-roads, but also the whole neighboring district, town and country, which felt and acknowledged the divinity and the power of the *Lares compitales* of their respective localities. (2) *Lares Urbani*, presided over cities. (3) *Lares præsites* originally tutelaries of the public common: finally guardians of the state. On the *Via Sacra* near the *Palatine Hill*, they had a temple and an altar. On coins they appear as the figure of a young man, wearing a *chlamys*, holding a spear, seated with a dog, symbol of vigilance. (4) *Lares viales*, of the roads, protecting genii of travelers. (5) *Lares permarini*, of the sea. (6) *Lares rustici*, of the country. (7) *Lares hostilii*, who guarded the state from enemies. The *Lares grundules*, too, should not be omitted. Their worship was connected with that of the white Sow of *Alba Longa* and its 30 young. Opposed to the *Lares*, who were peaceful, happy spirits of the dead, were the *Larvæ*, bearing a name which betrays its connection with the Latin word *Lar* just as the parallel word form "*arvum*" or "*arvas*" betrays its affinity with the Latin word "*arare*." These *Larvæ*, unlike the *Lars*, were uncanny and disquieting apparitions, as were likewise those ghost-like spectres, which the Roman knew as *Lemures*.

The *Lars* were worshipped daily in the Roman home, particular honors being paid them on the *Kalends*, the *Nones* and the *Ides*, of the Roman month. Originally each household had only a single *Lar*; and the shrine, a small domestic chapel, sheltering an image of the good spirit, was kept in each home,—the Roman gave this shrine the name of *Ædícula* or *Lararium*. The image of the god was sometimes of stone, of wood, of metal, in the last case, sometimes even of silver.

In early times the *Lar* stood in the *Atrium*; but later, when the family hearth was removed, it was placed elsewhere in the Roman home. At home a Roman felt himself surrounded by invisible friends and guardians, and these sentiments found expression in festive gatherings, at which the *Lararium* was thrown wide open, and the exposed *Lar* garlanded about with flowers. Every morning a prayer was made to the idol, and at each meal offerings of food and of drink were set before him. Then a part of the offering was placed on the hearth and finally taken up and shaken into the flames. Whenever a son of the family assumed the *toga virilis*; whenever the birthday of the head of the family recurred: whenever a new bride

entered into the family circle; or whenever the festival of the *Caristia* in memory of the deceased was celebrated, on these and on the occasion of every other event of importance to a Roman family, special offering and sacrifice were made to the *Lar*. He (for as the Romans conceived this idol, he was an animated being) was on such occasions crowned with wreaths of flowers; cakes and honey, wine and incense, and swine,—all were laid before him. The worship of the *Lares* persisted throughout the Roman pagan period, changing its character considerably as time went on; and its hold upon the Roman soul appears to have been such, that long after the inception of Christianity we hear of a Roman emperor, *Alexander Severus*, who numbered among his household gods, besides images of *Alexander of Macedon*, and *Abraham*, a figure, even the *Lar of Jesus Christ*. The *Lar* was represented variously. Sometimes as a youth, his head covered by a hat, with a traveler's stave in one hand, and accompanied by a dog. Again, we find the *Lar* figured as a youth: in short, high-girt tunic (symbolic of readiness to serve); he holds a *ryton* (drinking horn) in one hand and carries a *patera* (cup) in the other. Witness to domestic happiness or misfortune, the *Lar* hallowed every domestic occurrence; his presence rendering every Roman home, as it were, a sacred temple. "No other nation," remarks one student of comparative religion, "except the Chinese, have carried the religion of the home so far" as have the Romans in their worship of the *Lares*.

LARSSON, *lär'sön*, *Carl Olaf*, Swedish painter: b. Stockholm, 28 May 1853. He studied in Stockholm and in Paris. After some ambitious early attempts he engaged in illustrating, gaining for himself the title of the "Swedish *Doré*." He then took up water-color painting and in the spring of 1883 he exhibited at the *Paris Salon* two water-colors which won a medal. He was from the first especially happy in his handling of colors, his work being spirited and vigorous and full of gaiety and charm. While he is credited with a French vivacity, the Scandinavian point of view is clearly expressed. He excelled in outdoor subjects and in pictures of home life. He also distinguished himself as a mural painter as well as in the field of water-color and oil painting. He was an earnest advocate of maintaining the national type of dress and coloring, pleading for the so-called "gaudy peasant colors that are needed contrasts to the ice and snow" of his native land. He executed the illustrations for *Rydberg's* (*Singoalla*) and the mural paintings in the *Fürstenberg Gallery* and the *National Museum*, Stockholm. Died, 1919.

LARVA, the young of an animal, when it differs from its parents in form and manner of life. In most invertebrates and in some of the lower vertebrates, the animal hatched from the egg is so different from the adult that in many cases the relationship was long unsuspected by naturalists, and the little creatures were given names as separate beings,—*zoëa*, *nauplius*, etc., now applied to the forms of *larvæ* they represent. These *larvæ* may grow by imperceptible degrees into the stature and likeness of the adult; or they may pass by comparatively sudden changes through a series of more or less

different forms, until finally the adult form is reached and retained. In the latter case the development is said to be by metamorphosis (q.v.), most completely and familiarly manifested by insects. Whatever the method, the course of larval growth in its successive stages recalls the phylogeny of its race—that is, the course of its evolution in history. Thus each of the various phases of the larval life of any of

FIG. 1.—A trochophore: a, anus; m, mouth.

the lower animals, like the foetal life of embryos of the higher ranks, indicates probable ancestral forms. Some of the most remarkable larvæ may be mentioned. Among the marine annelids a larva known as the *trochophore* or *trochosphere* (Fig. 1) is common. It has a short compact body, traversed by the alimentary canal, and has one or more bands of cilia around the body and a sensory patch at the top of the head. By feeding, this larva grows, the increase being chiefly in length, and with this increase, the joining or metamerism of the body, so noticeable in the adult, appears. Other worms have different types of larvæ, among them the *pilidium* of the nemertines (Fig. 2), shaped somewhat like a chapeau with enormous ear lappets. Between these is the mouth which leads to a large blind sac, the

FIG. 2.—A pilidium.

stomach of the worm. The worm itself develops inside the pilidium and later escapes from it to continue its existence, leaving the rest to die.

Among the mollusks larvæ like the trochophore occur, and it is the existence of these larvæ which leads naturalists to think that annelids and mollusks, so different in the adult, had a common ancestry. Later, with the appearance of molluscan characters, a larva

known as the *veliger* may appear. This is characterized by a large disk on the top of the head, which serves for a time as a swimming organ and is later lost.

All of the lower and some of the higher crustacea pass through a so-called *nauplius* stage (Fig. 3). The adult crustacean consists of several segments, but the nauplius is without joints, has a single eye, a straight alimentary canal, the mouth being overhung by an enormous upper lip, and three pairs of appendages, which later become changed into the two pairs of antennæ and the mandibles of the adult. The first pair of the nauplian appendages are

FIG. 3.—Nauplius of *Sacculina*.

simple and apparently are only sensory, while the two remaining pairs are two-branched, and serve as swimming organs, the basal portions being also used as jaws to force food into the mouth which lies between them. In the higher crustacea two other and better developed larvæ known as the *zoëa* and *megalops* may appear.

Possibly the most remarkable larvæ occur among the echinoderms. These forms, exemplified by the starfish and sea-urchin, are noticeable for their radial symmetry, but in the larvæ, of which there are several distinct types, not a trace of a radial arrangement of parts can be found. They are rather markedly bilaterally symmetrical, with well-marked dorsal and ventral surfaces, which, however, do not correspond with the upper and lower surfaces

FIG. 4.—Pluteus of a sea-urchin.

of the adult. Some of these larvæ are more or less barrel-shaped, but in others, as in the *pluteus* (Fig. 4) and *bipinnaria* (Fig. 5), the body is drawn out into a number of processes, soft and flexible in the latter, but stiffened in the pluteus by internal calcareous rods. The starfish or sea-urchin later arises on one

side of this larva, the processes are absorbed and the radial arrangement is superimposed upon the bilateral features in the adult, without, however, completely obliterating them.

FIG. 5.—Bipinnaria of a starfish.

The larval forms of insects vary greatly both in their form and in the completeness of their metamorphosis. They may be divided into two classes, the *eruciform* and the *thysanuriform*. The former include those which are worm-like, such as the caterpillars of moths and butterflies, the grubs of beetles, the maggots of flies, and the like. They are the most numerous and conspicuous forms, and are active and voracious, and do nearly all the damage to be attributed to injurious insects. The thysanuriform larvae are those which nearly resemble the parents, such as the nymphs of the dragonfly and related groups. The second stage of larval life among insects is a very different existence, usually stationary and quiescent, and is called the *pupa stage* (see PUPA). Some larvae among insects and elsewhere may breed—a phase of reproduction called paedogenesis.

The value of the different forms and habits of life assumed by animals in passing through the larval stage or stages is that it tends to prevent the extinction of the species, since if at any moment all the adults were swept out of existence, the young living in a different station would continue to represent and revive the species. "This law is seen to hold good among the insects," as Alpheus S. Packard points out, "where many species are represented in the winter-time by the egg alone, others by the caterpillar, others by the chrysalis, while still others hibernate as imagoes. Again, in the marine species, the free-swimming young are borne about by the ocean and tidal currents, and in this what in adult life are the most sedentary forms become widely distributed from coast to coast and from sea to sea." On the other hand, the larval forms of fixed marine animals serve as food for fishes, especially young fishes and numerous invertebrates, which, without this resource, would starve; and larvae of insects are the principal resource for food of birds in the breeding season, when all the small, inland birds must feed their nestlings on caterpillars and grubs, for the most part, even when they are seedeaters as adults. Certain larvae enter extensively into the food-supply of many mammals, and are even eaten or become otherwise useful

to man. Some are artificially cultivated for his service, the silkworms, for an example.

Among vertebrates larvae are rare, and appear only in the lower forms, those of the lamprey (*Ammocoetes*), of eels (*Leptocephali*), of certain salamanders (*Axolotl*), and of frogs (tadpoles), being the most noticeable.

LARVAE, also **LEMURE**, in Roman mythology, ghosts conceived as the souls of the dead revisiting earth at night with harmful intent. They were exorcised by the head of the household in a ceremonial ritual held at midnight May 9, 11 and 13; which comprised a festival called "lemuralia" or "lemuria," and at which games were played with other suitable observations. Later the term came to mean supernatural monsters or goblins.

LARYNGITIS, lăr-in-jī'tis. See NOSE AND THROAT, DISEASES OF.

LARYNGOSCOPE, lă-ring'gō-skōp, an instrument for examining the larynx. The modern indirect laryngoscope was invented about 1855 by a singing teacher, Manuel Garcia (1805–1906), although the use of a reflecting mirror had been suggested as early as 1837 by Robert Liston (1794–1847). The art of modern laryngoscopy should be credited to two Vienna surgeons, Ludwig Türck (1810–1868) and Johann Nepomuk Czermak (1828–1873), both of whom published an account of its value in medical practice in the same year (1858). The instrument consists of a small plane mirror attached to a metal handle about four inches long, at an angle of about 120 degrees. The mirror is introduced into the mouth of the person undergoing examination and held near the back of the pharynx, while a light is thrown upon it from a reflector worn on the forehead of the examiner. A different type of laryngoscope is sometimes used, especially in bronchoscopy, known as the direct laryngoscope. This type is provided with a small electric light for direct examination. By the use of the laryngoscope, the mechanism of the voice may be studied and disease of the larynx, especially that involving the vocal cords, may be detected. By such examination incipient malignant disease or tuberculosis of the larynx or the vocal cords is commonly diagnosed. Its use also permits local medicinal applications to be made and certain operations to be performed. See also SURGERY.

HAROLD W. JONES, M.D.,
Editor, *Blakiston's New Gould Medical Dictionary*.

LARYNX, lăr'ingks, a tubular organ whose framework consists of cartilage and elastic membrane. It is situated at the upper part of the trachea or windpipe. Its inner surface is covered with mucous membrane from which are formed a pair of vocal folds or cords. These are thrown into vibration by the passage of air through the larynx and function to produce the voice. They serve also to regulate the volume of air within the cavity of the larynx, often called the voice box.

The principal laryngeal cartilages are the thyroid, the cricoid, and the epiglottis. The thyroid cartilage is single and forms the largest part of the larynx, being composed of two leaves, one on either side, which unite to form the

different forms, until finally the adult form is reached and retained. In the latter case the development is said to be by metamorphosis (q.v.), most completely and familiarly manifested by insects. Whatever the method, the course of larval growth in its successive stages recalls the phylogeny of its race—that is, the course of its evolution in history. Thus each of the various phases of the larval life of any of

FIG. 1.—A trochophore: a, anus; m, mouth.

the lower animals, like the foetal life of embryos of the higher ranks, indicates probable ancestral forms. Some of the most remarkable larvæ may be mentioned. Among the marine annelids a larva known as the *trochophore* or *trochosphere* (Fig. 1) is common. It has a short compact body, traversed by the alimentary canal, and has one or more bands of cilia around the body and a sensory patch at the top of the head. By feeding, this larva grows, the increase being chiefly in length, and with this increase, the joining or metamerism of the body, so noticeable in the adult, appears. Other worms have different types of larvæ, among them the *pilidium* of the nemertines (Fig. 2), shaped somewhat like a chapeau with enormous ear lappets. Between these is the mouth which leads to a large blind sac, the

FIG. 2.—A pilidium.

stomach of the worm. The worm itself develops inside the pilidium and later escapes from it to continue its existence, leaving the rest to die.

Among the mollusks larvæ like the trochophore occur, and it is the existence of these larvæ which leads naturalists to think that annelids and mollusks, so different in the adult, had a common ancestry. Later, with the appearance of molluscan characters, a larva

known as the *veliger* may appear. This is characterized by a large disk on the top of the head, which serves for a time as a swimming organ and is later lost.

All of the lower and some of the higher crustacea pass through a so-called *nauplius* stage (Fig. 3). The adult crustacean consists of several segments, but the nauplius is without joints, has a single eye, a straight alimentary canal, the mouth being overhung by an enormous upper lip, and three pairs of appendages, which later become changed into the two pairs of antennæ and the mandibles of the adult. The first pair of the nauplian appendages are

FIG. 3.—Nauplius of *Sacculina*.

simple and apparently are only sensory, while the two remaining pairs are two-branched, and serve as swimming organs, the basal portions being also used as jaws to force food into the mouth which lies between them. In the higher crustacea two other and better developed larvæ known as the *zoëa* and *megalops* may appear.

Possibly the most remarkable larvæ occur among the echinoderms. These forms, exemplified by the starfish and sea-urchin, are noticeable for their radial symmetry, but in the larvæ, of which there are several distinct types, not a trace of a radial arrangement of parts can be found. They are rather markedly bilaterally symmetrical, with well-marked dorsal and ventral surfaces, which, however, do not correspond with the upper and lower surfaces

FIG. 4.—Pluteus of a sea-urchin.

of the adult. Some of these larvæ are more or less barrel-shaped, but in others, as in the *pluteus* (Fig. 4) and *bipinnaria* (Fig. 5), the body is drawn out into a number of processes, soft and flexible in the latter, but stiffened in the pluteus by internal calcareous rods. The starfish or sea-urchin later arises on one

side of this larva, the processes are absorbed and the radial arrangement is superimposed upon the bilateral features in the adult, without, however, completely obliterating them.

FIG. 5.—Bipinnaria of a starfish.

The larval forms of insects vary greatly both in their form and in the completeness of their metamorphosis. They may be divided into two classes, the *eruciform* and the *thysanuriform*. The former include those which are worm-like, such as the caterpillars of moths and butterflies, the grubs of beetles, the maggots of flies, and the like. They are the most numerous and conspicuous forms, and are active and voracious, and do nearly all the damage to be attributed to injurious insects. The thysanuriform larvae are those which nearly resemble the parents, such as the nymphs of the dragonfly and related groups. The second stage of larval life among insects is a very different existence, usually stationary and quiescent, and is called the *pupa stage* (see PUPA). Some larvae among insects and elsewhere may breed—a phase of reproduction called *paedogenesis*.

The value of the different forms and habits of life assumed by animals in passing through the larval stage or stages is that it tends to prevent the extinction of the species, since if at any moment all the adults were swept out of existence, the young living in a different station would continue to represent and revive the species. "This law is seen to hold good among the insects," as Alpheus S. Packard points out, "where many species are represented in the winter-time by the egg alone, others by the caterpillar, others by the chrysalis, while still others hibernate as imagoes. Again, in the marine species, the free-swimming young are borne about by the ocean and tidal currents, and in this what in adult life are the most sedentary forms become widely distributed from coast to coast and from sea to sea." On the other hand, the larval forms of fixed marine animals serve as food for fishes, especially young fishes and numerous invertebrates, which, without this resource, would starve; and larvae of insects are the principal resource for food of birds in the breeding season, when all the small, inland birds must feed their nestlings on caterpillars and grubs, for the most part, even when they are seedeaters as adults. Certain larvae enter extensively into the food-supply of many mammals, and are even eaten or become otherwise useful

to man. Some are artificially cultivated for his service, the silkworms, for an example.

Among vertebrates larvae are rare, and appear only in the lower forms, those of the lamprey (*Ammocoetes*), of eels (*Leptocephali*), of certain salamanders (*Axolotl*), and of frogs (tadpoles), being the most noticeable.

LARVAE, also **LEMURE**, in Roman mythology, ghosts conceived as the souls of the dead revisiting earth at night with harmful intent. They were exorcised by the head of the household in a ceremonial ritual held at midnight May 9, 11 and 13; which comprised a festival called "lemuralia" or "lemuria," and at which games were played with other suitable observations. Later the term came to mean supernatural monsters or goblins.

LARYNGITIS, lăr-in-jī'tis. See NOSE AND THROAT, DISEASES OF.

LARYNGOSCOPE, lă-rîng'gô-skôp, an instrument for examining the larynx. The modern indirect laryngoscope was invented about 1855 by a singing teacher, Manuel Garcia (1805-1906), although the use of a reflecting mirror had been suggested as early as 1837 by Robert Liston (1794-1847). The art of modern laryngoscopy should be credited to two Vienna surgeons, Ludwig Türck (1810-1868) and Johann Nepomuk Czermak (1828-1873), both of whom published an account of its value in medical practice in the same year (1858). The instrument consists of a small plane mirror attached to a metal handle about four inches long, at an angle of about 120 degrees. The mirror is introduced into the mouth of the person undergoing examination and held near the back of the pharynx, while a light is thrown upon it from a reflector worn on the forehead of the examiner. A different type of laryngoscope is sometimes used, especially in bronchoscopy, known as the direct laryngoscope. This type is provided with a small electric light for direct examination. By the use of the laryngoscope, the mechanism of the voice may be studied and disease of the larynx, especially that involving the vocal cords, may be detected. By such examination incipient malignant disease or tuberculosis of the larynx or the vocal cords is commonly diagnosed. Its use also permits local medicinal applications to be made and certain operations to be performed. See also SURGERY.

LARYNX, lăr'îngks, a tubular organ whose framework consists of cartilage and elastic membrane. It is situated at the upper part of the trachea or windpipe. Its inner surface is covered with mucous membrane from which are formed a pair of vocal folds or cords. These are thrown into vibration by the passage of air through the larynx and function to produce the voice. They serve also to regulate the volume of air within the cavity of the larynx, often called the voice box.

The principal laryngeal cartilages are the thyroid, the cricoid, and the epiglottis. The thyroid cartilage is single and forms the largest part of the larynx, being composed of two leaves, one on either side, which unite to form the

FIG. 1.
Larynx internally.

FIG. 2.
Larynx externally.

prominence known as the Adam's apple. The cricoid is a ringlike single cartilage at the lower end of the larynx and is connected with the first tracheal ring. The epiglottic cartilage is also single and is covered for the most part by mucous membrane. It is thin and leaflike, standing between the root of the larynx and the body of the hyoid bone. It guards the entrance to the larynx and prevents passage of foreign bodies into the trachea.

The larynx is provided with two sets of muscles, the extrinsic or outer group acting upon the voice box as a whole, and the intrinsic or inner group which act upon its parts, modifying the size of the opening of the glottis and the degree of tension of the vocal cords. These last are folds which form lips that can be approximated to upper tracheal opening (glottis). Variations in the form of the chink of the glottis produced by muscular action will effect changes in the sound and pitch of the voice as well as its quality and volume, in much the same way as tones are produced by musical instruments.

The mechanism of the larynx, as described, is essential to life, since without its protective function man would choke to death on attempting to swallow food. It is, however, not an essential organ of speech, a useful voice being often obtained following surgical removal of the larynx. Its function as a regulatory respiratory organ is important. The speech mechanism is best understood if it is borne in mind that the larynx makes only a sound by setting in motion a column of air while articulate words (phonation) are formed by the molding action of the pharynx, tongue, palate, lips, and teeth upon the column of air. In the accompanying cut, Fig. 1 shows C the larynx internally, B the epiglottis, A the trachea, and D the esophagus. In Fig. 2, J is the ringed trachea, B the hyoid bone, N the hypothyroid membrane, O the hypothyroid ligament, G the thyroid cartilage, H the cricoid cartilage, P the median cricothyroid ligament. See also NOSE AND THROAT, DISEASES OF; VOICE.

HAROLD W. JONES, M.D.

LAS ANIMAS, lās ān'ī-mās, city, Colorado, seat of Bent County, situated at an altitude of 4,050 feet on the Arkansas River, 20 miles east of La Junta, and served by the Atchison, Topeka and Santa Fe Railroad and federal and state highways. Located in the fertile Arkansas Valley with its farming, poultry and livestock raising, and dairying, it is a shipping point for much of the produce. It has a general hospital and there is a veterans hospital nearby. It was founded in 1869 and incorporated in 1882. Pop. (1950) 3,223.

LAS CASAS. See CASAS, BARTOLOMÉ DE LAS.

LAS CASES, lās káz', COMTE Emmanuel Augustin Dieudonné Marin Joseph de, French historian, one of the companions of Napoleon at St. Helena: b. Chateau Las Cases, near Revel, June 21, 1766; d. Passy-sur-Seine, May 15, 1842. He was educated at military schools in Vendôme and Paris, and when the revolution broke out he took part with the Royalists. After the defeat of the Prussians in Champagne (1795) he fled to London, where he lived as a teacher. While here he executed his *Atlas historique, chronologique, géographique et généalogique* (1803-1804), which he published in Paris under the name of Lesage.

When the émigrés were recalled by Napoleon, Las Cases returned to Paris. Having entered the army of Jean B. J. Bernadotte (1809) he gained the favor of Napoleon, who in 1810 made him chamberlain and count of the empire. In 1814 he refused to assent to the request for Napoleon's abdication and went to England, returning to France during the Hundred Days. After the final defeat of the emperor at Waterloo he followed him to St. Helena, where with his son he devoted himself to the care of Napoleon, and passed his evenings in recording the emperor's remarks. These were subsequently published in his *Mémorial de Sainte Hélène* (1821-1823). Having written a letter to Lucien Bonaparte commenting freely on the treatment to which Napoleon was subjected, he was sent from the island in November 1816 to the Cape of Good Hope, presently being taken to England, and then to the Continent and to Frankfurt-am-Main, where he at last received his liberty after 13 months captivity. He was not allowed to return to France until the death of Napoleon. He wrote, in addition to the works above mentioned, his own life, *Mémoires d'E.A.D., Comte de las Cases* (1818).

LAS CRUCES, lās krōō'sēs, town, New Mexico, seat of Dona Ana County, at an altitude of 3,895 feet, situated near the Rio Grande, 42 miles north-northwest of El Paso, Texas, and served by the Atchison, Topeka, and Santa Fe Railroad, federal highways, and an airport. Las Cruces is situated in an irrigated fruit, alfalfa, cotton, sugar beet, and livestock raising region, and near the silver, lead, and fluorspar deposits of the Mesilla Valley. The New Mexico College of Agriculture and Mechanic Arts (q.v.) is near the city, and the White Sands Proving Grounds lie to the northeast.

Founded in 1848, Las Cruces was incorporated as a town in 1907. Its attractive climate has considerably increased its population during the last few years. Pop. (1950) 12,325.

LAS PALMAS, lās pāl'mās (officially LAS PALMAS DE GRAN CANARIA), seaport city, Grand Canary Island, capital of Las Palmas Province, the fourth port of Spain and first in point of tonnage, situated in the northeast of the island, 57 miles southeast of Santa Cruz de Tenerife and 830 miles southwest of Cadiz. It is an attractive place, beautifully situated in a fertile valley, and contains a fine town hall and a museum richer in aboriginal remains than any other in the world. Besides the 18th century cathedral, it has a number of quaint churches. Christopher Columbus attended Mass in the original building of one of them before setting out for America in 1492. There is a large resi-

dential colony of Englishmen, who control a good part of the business of Las Palmas.

The principal industries are fishing, ship-building, and the manufacture of woolen goods, fertilizer, wines (the famous Canary sack), matches, ceramics, hats, leather goods, and glass. Potatoes, bananas, tomatoes, almonds, dried fish, cochineal, tobacco, and sugar are among the exports. The adjoining port of Puerto de la Luz is an important fueling and supply station for deep-sea vessels. Steamer services are maintained at this island crossroad with the principal European ports, and with the west coast of Africa, Australia, New Zealand, and America. Pop. (1950) 151,411.

LAS VEGAS, lās vā'gās, city, Nevada, seat of Clark County, at an altitude of 2,033 feet, 225 miles northeast of Los Angeles and 25 miles west-northwest of Hoover Dam, served by the Union Pacific Railroad, federal highways, and an airfield with scheduled service. The principal source of income are tourists, who have made this town a Mecca for pleasure seekers because of its night clubs, gambling casinos, and resort hotels. Mining, railroading, and stock-raising are carried on in the area. Manufactures are dairy products and beverages. Originally a watering place on the trail to California, the site was first occupied by the Mormons in 1855 and was abandoned two years later. In 1903 it was made a division point of the railroad, and in 1911 it became a city. It has a public library and two hospitals, and within the decade between the 1940 and 1950 census has taken a phenomenal leap in population making it the second largest city in the state. It has a commission form of government. Pop. (1950) 24,624.

LAS VEGAS, city and town, New Mexico, in San Miguel County, situated at an altitude of 6,392 feet on both sides of the Callinas River, and served by the Atchison, Topeka and Santa Fe Railroad, state and federal highways, and a municipal airfield. It is situated about 40 miles by air east of Santa Fe. The city, sometimes called East Las Vegas, is the county seat, and contains the newer industrial and residential sections. Located in a cattle and sheep raising country, it has a brickyard and a creamery. It also has a Carnegie library, the New Mexico Highlands University, and the New Mexico State Hospital for the Insane. The city and town have a mayor and council government. A well-known health and pleasure resort, there are hot springs and dude ranches in the vicinity. A United States Air Force base is situated here.

The town of Las Vegas, sometimes called Old Town or West Las Vegas, was settled between 1823-1833 by Spaniards, and in 1846 Gen. Stephen Watts Kearny, commanding the Army of the West, took possession of it for the United States. To the east is Conchas Dam (1939), constructed for flood control and water and power supply purposes. Pop. (city and town, 1950) 13,763.

LASCARIS, lās'kā-rīs, Constantine, Greek scholar and grammarian: b. Constantinople, 1434?; d. Messina, 1501. He came of a Bithynian noble family, which had among its members three emperors of Nicaea in the 13th century. The fall of Constantinople in 1453 forced him to flee to Corfu. He later went to Italy where he

was appointed Greek tutor to Hippolita, daughter of Duke Francesco Sforza of Milan. He taught in Rome and later went to Naples at the request of Ferdinand I where he delivered a course of lectures on Greece. He also taught in Spain, and for the last 35 years of his life he taught Greek at Messina. Among his pupils there was the future Cardinal Pietro Bembo. He collected and copied many manuscripts which he willed to the University of Messina, and which were taken to Spain in 1712 and placed in the National Library in Madrid. His *Grammatica Graeca, sive compendium octo orationis partium* (1476) was the first work printed in the Greek language.

LASCARIS, Theodore I, emperor of Nicaea; d. 1222. He came of a noble Byzantine family, was son-in-law of Alexius III and was distinguished by his exploits in defeating the Latin invasion of Constantinople in 1203-1204. After the fall of the city he went to Nicaea and there founded a new Byzantine state which became a rallying point for his countrymen and of which he became emperor in 1206. He maintained his empire against the aggressions of the Latin emperor of Constantinople and Alexius I (Grand Comnenus) of Trebizond, carried successful war into the enemy's territory and in 1210 he captured Alexius and wrested considerable territory from the Seljuk Turks. His daughter, Irene Lascaris, married his successor, John III Ducas, and became the mother of Theodore II, who reigned from 1254-1258, and recovered Thrace from the Bulgarians in 1255-1256.

LASKER, lās'kēr, Eduard, German politician: b. Jarotschin, Posen, Oct. 14, 1829; d. New York City, Jan. 5, 1884. He was of Jewish descent, and was educated at the universities of Breslau and Berlin. He spent three years in England in the study of political conditions there, and on his return entered the government service. He was elected in 1865 to the Prussian Chamber of Deputies and subsequently sat both there and in the lower house of the German Diet for the district of Meiningen. He was for a time associated with the "Fortschrittspartei" or Progressives, and in 1866 assisted in forming the National Liberal Party, from which he later withdrew in opposition to Otto E. L. von Bismarck's economic policy.

He took an active part in the civil consolidation of the German Empire, and had a great deal to do with judicial reform, contributing more than any individual of his time to the codification of the German law.

LASKER, Emanuel, German chess champion: b. Berlinchen, Dec. 24, 1868. He chose mathematics as a profession, but eventually turned his attention to chess, playing with such success that from 1892 he triumphed over all competitors both in tournaments and duel matches. He outplayed, without losing a single game, Joseph H. Blackburne, Henry E. Bird, and Jacques Mieses of Leipzig. In 1892 he won the first prize in the London tournament, and in the International tournament at New York in 1894 beat all the best players, including William Steinitz, champion of the world. A decisive match was then arranged between him and the famous Steinitz at Moscow and came

off December 1896 and January 1897. Lasker won by 10 games to 2, 5 being drawn. He had arranged a match with the celebrated Russian player, Akiba Rubenstein (b. 1880), for August 1914, which was canceled on the outbreak of the First World War. He maintained his world's championship until 1921, when he lost at Havana, Cuba, to José Raúl Capablanca (1888–1942); he resigned the match on the plea of ill health after losing 4 games, drawing 10, and winning none. In 1902–07 he published *Lasker's Chess Magazine*, and he also wrote works on chess, mathematics, and philosophy. During his last years he made his home in New York City, where he died Jan. 11, 1941.

LASKI, lās'ki, Harold Joseph, British political economist, historian, and author: b. Manchester, June 30, 1893; d. London, March 24, 1950. He went to New College, Oxford University, where he took a first class in the Honor School of Modern History in 1914. Already attracted to the labor movement, he wrote editorials for the London *Daily Herald*, and, not accepted for military service in the First World War, he went to Canada in the fall of 1914 to become lecturer in history at McGill University. In 1916 he transferred to a like post at Harvard, and during the four years he was there he was also Henry Ward Beecher lecturer at Amherst College, 1917, and Harvard lecturer at Yale University, 1919–20. Returning to Britain in 1920, he joined the faculty of the School of Economics and Political Science, London University; he was appointed professor of political science in 1926, and meanwhile, as an active figure in the Fabian Society, he had become one of Britain's leading interpreters of socialism. During 1922–25 he lectured on political science at Magdalene College, Cambridge University; he returned to Yale as visiting professor in 1931, and as Storrs Lecturer two years later; he went to Moscow in 1934 to lecture at the Institute of Soviet Law; and he was Donnellun Lecturer at Trinity College, Dublin, in 1936. In 1926 he was named a member of the Industrial Court, and subsequently he served on several other official and semiofficial bodies. He had joined the Labour Party in 1920, and soon he became identified with its left wing. Believing that capitalism was doomed, he asserted that the peaceful acceptance of socialism was the only alternative to revolution. During the Second World War he was given no post in the coalition administration formed by Prime Minister Winston (Leonard Spencer) Churchill, but nevertheless he exerted great influence in the formulation of the Labour Party's policy and development of its legislative program. In January 1944 he was elected vice chairman of the party's national executive committee, and in May of the following year he succeeded Ellen Wilkinson as chairman. He sought no parliamentary seat in the general election of July 1945, but after the Labour Party had been returned to office he continued to be one of its most powerful figures. From 1920 he was a regular contributor to *The Nation*, a liberal weekly published in London, and he wrote a large number of works, which included: *The Problem of Sovereignty* (1917); *Authority in the Modern State* (1919); *Communism* (1927); *Democracy in Crisis* (1933); *Parliamentary Government in England* (1938); *The American Presidency* (1940); *The Danger*

of Being a Gentleman (1940); *Where Do We Go from Here?* (1940); *The Strategy of Youth* (1941); *Marx and Today* (1943); *London—Washington—Moscow: Partners in Peace?* (1943); *Faith, Reason, and Civilization* (1944); *Will Planning Restore Freedom?* (1944).

LASO DE LA VEGA, Garci. See GARCILASO DE LA VEGA.

LASSA, lās'sä. See LHASA.

LASSALLE, lä-säl', Ferdinand, German Socialist: b. Breslau, April 11, 1825; d. Geneva, Aug. 28, 1864. He studied at the universities of Breslau and Berlin.

Toward the end of 1844 he met at Berlin the Countess Sophie von Hatzfeldt, who had contracted an unfortunate marriage, conducted her suit for separation and 11 years later brought it to a successful issue. He first made himself known as a leader during the democratic troubles in 1848, and was imprisoned for a year for alleged inciting to revolt. In 1858 he produced a work on the philosophy of Heraclitus, and in 1861 published his *System of Acquired Rights*. Thereafter he proceeded to organize the working classes, which caused the government to accuse him of sedition, and he was imprisoned for four months. He was at first allied with the party of the Progressists, but in 1862 he broke with them; in 1863 he issued his famous *Offenes Antwortschreiben*, a brochure in which he set forth his working-class program, and later in the same year founded a labor union (allgemeiner deutscher Arbeiterverein), and began Socialist propaganda in Germany. In 1864 he published an attack on the Manchester school of economists, under the title *Herr Bastiat-Schultze von Delitzsch der ökonomische Julian, oder Kapital und Arbeit*. In the summer of the same year he was killed in a duel occasioned by a love affair.

LASSELL, lä-säl', William, English astronomer: b. Lancashire, June 18, 1799; d. Oct. 5, 1880. In 1820 he built an observatory at Liverpool, devising an improved type of reflecting telescope and a method of polishing the specula. With this telescope he discovered the satellite of Neptune in 1847, observed the eighth satellite of Saturn in 1848, and in 1851 discovered two new satellites of Uranus. In 1861, at Valetta, on the island of Malta, he mounted equatorially a reflecting telescope, and at that place, until 1865, he made observations, also describing new nebulae and correcting many of his former results.

LASSEN, lās'sen, Christian, Norwegian philologist and linguist: b. Bergen, Norway, Oct. 22, 1800; d. Bonn, Prussia, May 8, 1876. He studied at Christiania, Heidelberg, and Bonn, at which last university he became, in 1830, extraordinary, and, in 1849, ordinary professor. With Eugene Burnouf (q.v.) he deciphered many Pali MSS., and the result of their labors was published by the Asiatic Society in an *Essay on the Pali or Sacred Language from the Peninsula beyond the Ganges*. He published with August Wilhelm Schlegel (q.v.) the *Ramayana* and the *Hitopadesa*, and was for many years editor of the *Zeitschrift für die Kunde des Morgenlandes*. His works related to a variety of Oriental languages and ancient history, embracing translations from the Hindu philosophy, the history

of Bactriana, Cabool and India, and cuneiform inscriptions.

LASSEN, Eduard, Danish composer: b. Copenhagen, 13 April 1830; d. Weimar, 15 Jan. 1904. He began his education at Brussels and 1851 won the "Prix de Rome." Through Liszt his opera 'Landgraf Ludwigs Brautfahrt' was produced in Weimar (1875), where he was made the following year "Kapellmeister" to the court. He retired in 1895. Of his compositions those which are most remarkable for talent and artistic sincerity are the operas 'Frauenlob' (1860); 'Le Captif' (1868). He wrote two symphonies and the music for Sophocles' 'Œdipus' and Goethe's 'Faust,' as well as numerous songs, etc.

LASSEN PEAK, Cal., volcanic peak of the Sierra Nevadas, on the boundaries between Plumas, Shasta, Lassen and Tehama counties, about 135 miles north of Sacramento, in latitude 40° 28' north. It was supposed to be extinct, but on 30 May 1914 clouds of steam and ash issued from the summit, and on 8 June and 18 July 1914 a column of steam rose to a height of 10,000 feet above the crest. The activity was credited to the great earthquake preceding it in Alaska and California. Its ancient lava beds are of vast extent and there are boiling springs and hot mud lakes at the base of the mountain. Altitude, 10,577 feet.

LASSERRE, la'sār, Paul Joseph Henri de Monzie, French religious writer: b. Carlux, 25 Feb. 1828; d. 1900. He studied law at Paris and in 1851 created a sensation by the publication on 2 December of 'L'Opinion et le coup d'état,' written in favor of the *coup d'état*. He was active in behalf of Poland, gaining the Pope's condemnation of the massacres of Warsaw; gained wide attention by his strictness on Renan's 'Vie de Jésus'; and was later noted for his writings on the Lourdes pilgrimage, where he stated that he had received benefit, and over which he had a bitter controversy with Zola. Author of 'L'Esprit et la Chair' (1859); 'La Pologne et la Catholicité' (1861); 'L'Evangile selon Renan' (1862); 'Notre-Dame de Lourdes' (1869); 'Episodes Miraculeux de Lourdes' (1883), etc.

LASSO, a long strong thong of buffalo-hide, rope or leather, with a running noose at one end, used by ranchmen and hunters. It is thrown in such a way as to fall over the horns or head of the animal, the hunter coiling one end round a high pommel on his saddle. When he makes a successful cast the hunter spurs his horse to its fullest speed, and the horse or other animal is almost strangled or borne to the ground and becomes an easy prey. Instead of a noose a leaden ball may be attached to the end of the thong, which is thrown so as to entangle the legs, neck or horns of the animal to be captured. The lasso has been used in the South American wars: it was employed against the French sentinels by some of the semi-barbarous tribes whom Russia had pressed into her armies during the Crimean War.

LASSO-CELLS, or **STINGING CELLS**, names applied to the cnidocysts of coelenterates. See NEMATOCYST.

LASSON, lä'són, Adolf, German scholar: b. Strelitz, Mecklenburg-Strelitz, 12 March 1832. He was educated at the University of

Berlin, where he became privat-docent of philosophy in 1877 and honorary professor in 1897. He was greatly influenced by the philosophy of Hegel. Author of 'Baco von Verulams wissenschaftliche Principien' (1860); 'Das Kulturideal und der Krieg' (1863); 'Meister Eckhart der Mystiker' (1868); 'Giordano Bruno' (1872); 'Das Gedächtnis' (1894); 'Der Leib' (1898); 'Aristotelische nikomachische Ethik' (1909), etc. Died, 1917.

LASSUS, la'süs', Jean Baptiste Antoine, French architect: b. Paris, 19 March 1807; d. Vichy, 15 July 1857. He studied at the École des Beaux-Arts and under Lebas and Labrousse. From Labrousse he imbibed the influences which started him toward the pre-eminence he attained in the 19th century Gothic revival in France. He was engaged with Duban and Viollet-le-Duc in the restoration of Sainte Chapelle in 1840-56, and in 1842 he began with Viollet-le-Duc the restoration of Notre-Dame. He was also engaged in the restoration of Saint-Germain-l'Auxerrois, the cathedral of Moulins and built the church of Saint Nicolas de Nantes as well as other churches and convents throughout the provinces of France. He was a contributor to *Annales archéologiques* and author of 'Monographie de la cathédrale de Chartres' in collaboration with Didron and Amaury Duval (1843); 'Réaction de l'Académie des beaux-arts contre l'art gothique' (1846); annotated 'Album de Villard de Honcourt' (1858).

LASSUS, Orlandus, or **LASSO, lä'sō Orlando** (originally ROLAND DELATTRE), German composer: b. Mons, in Hainaut, 1520 or 1530; d. Munich, June 1594. As a composer he was excelled only by Palestrina among musicians of the 16th century. About 1556 he went to Munich as chapel-master to Albert, Duke of Bavaria, and in 1562 became chapel-master, an office which he held till his death. Among his more than 2,000 works are some 60 masses, many madrigals and songs, and the celebrated music for the Seven Penitential Psalms. In the royal library at Munich is the richest collection of his works. His sons published a collection of his motets entitled 'Magnum Opus Musicum' (1604, 17 vols., folio). An edition of his collected works appeared at Leipzig 1893, et seq.

LAST DAYS OF POMPEII, The. Bulwer-Lytton's 'The Last Days of Pompeii,' published in 1834, has as its subject the destruction of Pompeii by fire, water, ashes and lava in the terrible eruption of Mount Vesuvius in the year 79 of the Christian era. The novel was mainly written at Naples near the scene of the ancient calamity in order that all incidents pertaining to it might be completely visualized. Bulwer climbed Mount Vesuvius, studied the excavations of the ruined city and was generally well prepared for the task by his knowledge of the classical literatures. It was his aim to restore the decadent life of Pompeii just before the destruction of the city. He reanimated, as it were, the skeletons found in houses, baths, temples and forum, all of which places he minutely described. These old skeletons, clothed in flesh and blood, became the dramatis personæ of his plot. Most of them were buried in the ruins; but the hero and heroine, Glaucus and Ione, escape by the aid of

Nydia, the Thessalian blind girl, and, being Greeks, retire to Athens. Nydia, hopelessly in love with Glaucus, drowns herself in the sea. Among others who survived is Olinthus, the Christian, who converts Glaucus and Ione to the new religion in which they are supremely happy.

Bulwer's novel annoys the reader of the present day by its stilted style, its melodrama and its sentimentalism; but these and other grave faults cannot blind the critic to the fact that 'The Last Days of Pompeii' is the most successful novel we have dealing with ancient life and manners, so difficult to restore at all. The catastrophe which Bulwer chose for his theme at once interests and appalls; and the last chapters, descriptive of the awful fate that overcame the inhabitants of Pompeii, reach a high level of vivid narration, quite sufficient to keep the novel alive.

WILBUR L. CROSS.

LAST JUDGMENT, The, subject of religious paintings based upon Matt. xxv, 31, et seq., when Christ shall return to judge the world. It was a subject much favored by mediæval artists, some of the greatest religious paintings and frescoes being founded upon the idea. Among them are that by Fra Angelico at the Florence Academy; one by Fra Bartolommeo painted in 1498-99 on the wall of the cloister of Santa Maria Nuova at Florence; Jean Coussin at the Louvre; a fresco by Giotto at Santa Maria dell' Arena, Padua; the fresco by Michelangelo in the Sistine Chapel at the Vatican; by Rubens in the Munich Gallery; by Tintoretto at Santa Maria dell Orto, Venice; the fresco by Peter von Cornelius at Ludwigskirche, Munich.

LAST LETTERS OF JACOB ORTIS, 'Ultime lettere di Jacopo Ortis' (1802), the most significant prose work of the Italian poet, Ugo Foscolo, is an autobiographical novel in epistolary form. Begun in 1798 when the author was a mere boy of 20 the history of this book is a romance in itself. Published in unfinished form in 1799, continued for an impatient editor by the unscrupulous Angelo Sassoli whose unauthorized edition was repudiated by Foscolo when he brought out his true text in 1802, the 'Ultime lettere' shows the influence of Rousseau's 'Nouvelle Héloïse' and still more of Goethe's 'Werther.' Like its German predecessor which antedated it by a quarter of a century, Foscolo's narrative reflects the pessimism, the unhealthy sentimentalism and the excessive morbidity of that period of social and political upheaval. The suicide in 1796 of Girolamo Ortis, a fellow student at the University of Pavia, Foscolo's unhappy love affairs, the Treaty of Campo Formio (17 Oct. 1797) by which Austria acquired Venice and which caused the poet's departure from his adopted state, became the genesis of these letters which so deeply stirred the patriotic ardor of the Italian youth of the succeeding generation. An exile from Venice, Ortis (Foscolo), in a series of letters to his friend Lorenzo (G. B. Niccolini), laments his country's servitude and gradually lays bare his hapless passion for the lovely Teresa, the affianced and later the bride of another. This correspondence runs from October 1797 until March 1799, when the wretched youth stabs himself to death after

writing an affecting farewell to Teresa. Such scenes as the meeting between Ortis and the aged poet Parini, the incident of the kiss, the final parting with Teresa and some splendid descriptions of nature, are full of feeling. The language, while not exempt from affectations, is a robust, eloquent and animated poetic prose. Although the intermingling of the patriotic motive with the love idyll weakens the unity of the work, the loss in artistic effectiveness is compensated by the intense passion for liberty that animates Ortis. It is the first modern Italian novel of incontestable merit and the harbinger of the romantic movement in Italy. Consult Martinetti and Antona-Traversi for a critical edition of the text (Saluzzo 1887); Albertazzi, A., 'Il Romanzo' (Milan 1902); Mazzoni, G., 'L'Ottocento' (Milan 1913); Marinoni, E., 'Prose . . . di Ugo Foscolo' (Milan 1913).

ALFRED G. PANARONI.

LAST OF THE MOHICANS, The. 'The Last of the Mohicans' was the second of the Leather-Stocking series which Fenimore Cooper wrote, and it stands second in the order in which these novels present the deeds and emotions of the greatest character American fiction has furnished to the world of the imagination. Perhaps less realistic than 'The Pioneers,' and less poetical than 'The Prairie,' 'The Last of the Mohicans' is still the most representative not only of the series, but of Cooper's romances in general. In this tale Leather-Stocking first reaches his true proportions. 'The Pioneers,' in which he had first appeared, had shown him somewhat hardened by age; only at the end of that book, when Natty, in search of simplicity and perfect freedom, withdraws from the settlements and plunges into the deeper woods, does he make his full appeal. In 'The Last of the Mohicans,' which presents Hawkeye, as he is now called, in the prime of his strength and valor, he has grown nobler as he has grown more remote, more the poet and hero as the world in which he moves has become more wholly his own. Chingachgook has undergone an even greater change. He had been known in 'The Pioneers' as Indian John, a drunken old vagabond who was dignified only by his death. 'The Last of the Mohicans' restores to him his cunning and pride. The purest romance of the story lies in Uncas, the son of Chingachgook, gallant, swift, courteous, a lover for whom there is no hope the last of his mighty line. Cooper was perfectly willing to admit that Uncas was idealized, like other epic and romantic heroes. It is clear also that Uncas possesses many of the virtues which Rousseau had said are to be found in the state of nature. Romantic idealization, however, and romantic sentiment cannot deprive Uncas of the perennial appeal which youth makes when cut off in the flower. Nor is a book which has added three such personages to fiction to be too lightly dismissed as without power of characterization.

The action and setting of 'The Last of the Mohicans' are on the same high plane as the characters. The forest, in which all the events take place, surrounds them with a changeless majesty which deepens, by contrast, the restless sense of danger. Flight and pursuit,

Cooper's favorite plot-device, fill almost the entire book; two white girls, being escorted from Fort Edward, on the Hudson, to Fort William Henry, on Lake George, are pursued by the hostile savages who infested that region during the French and Indian War; they are captured and, after another desperate pursuit, rescued. The thrilling contest is carried on with every subtle trick known to Magua, the villain, and to Hawkeye and the Mohicans, who are the real heroes of the piece, although there is a conventional lover for one of the conventional girls. Among the most moving moments in fiction is that in which Uncas reveals himself to the Delawares; of all Cooper's climaxes it is the one built up with the greatest skill. The coincidences are occasionally strained, and the style is careless, but the narrative force of the book, no matter what its defects, is too compelling for it to be called less than a masterpiece.

CARL VAN DOREN.

LAST PURITAN, The, a novel by George Santayana (q.v.), published in 1936, with the subtitle, *A Memoir in the Form of a Novel*.

A study of American puritanism gone to seed, the book is presented with great fullness through the wealthy effete New England antecedents, and the short hollow life (and accidental death in France during World War I) of the leading character, Oliver Alden. He befriends his cousin Mario Van de Weyer, whose zestful hedonism is in sharp contrast with Oliver's asceticism, intellectuality, and moral earnestness. The cousins form a compound hero whose double personality advances the argument of the novel. They play Siamese-twin roles opposite young women who also lend themselves to the idea of a composite heroine. Edith Van de Weyer is an American hothouse product of money and position; the other, Rose Darnley, the daughter of an English clergyman, who contracted an unfortunate marriage, is a sheltered garden flower, grown exquisite through isolation and simple living. They have about them the atmosphere of specimens under the lens of an intellectual microscope.

Sophisticated and multitudinous insights and judgments upon wealth, social pretension, education, taste, ideas, emotions, and motivations crowd the cerebral climate of the novel which, in sum, resembles a brilliant and eloquent symposium, not unlike a Platonic dialogue that has been translated into modern language, dress, point of view, and geographic motility. As one of the characters is made to say in the epilogue, which comments on what has gone before: "There is clairvoyance in every quarter; whereas in the real world we are all unjust to one another and deceived about ourselves."

MARKHAM HARRIS,

Department of English, University of Washington.

LAST ROSE OF SUMMER, The. See GEORGE MOORE.

LASTMAN, läst'män, Pieter, Dutch painter: b. Amsterdam, 1583; d. Haarlem, 1633. He studied under Gerrit Pieterz and, in Rome, with Elsheimer. He established a studio in Amsterdam, and in 1623, Rembrandt became one of his pupils. His work was largely of religious and mythological subjects and includes: *Repose in Egypt* (1608), Rotterdam Museum; *Adoration of the Shepherds* (1629), Haarlem Museum; and *Raising of Lazarus* (1632), Hague Museum.

LASUS, Greek lyric poet: b. Hermione, Argolis. He lived during the reign of Hipparchus, in the early part of the 6th century. A teacher of music and poetry to Pindar and a rival of Simonides, he was the author of the first treatise on music theory and is considered inventor of the dithyrambus.

LASZLO de LOMBOS, Philip Alexius, Hungarian-British portrait painter: b. Budapest, 1869; d. Hampstead, England, Nov. 22, 1937. He received art training in Budapest, Munich, and Paris, and by the end of the century had become one of the famous portrait painters of the time. In 1899, for his portrait of Prince Hohenlohe, he was awarded the gold medal of the Paris salon and won it again the following year for a portrait of Pope Leo XIII. Famous contemporaries whom he painted included: President Woodrow Wilson, President and Mrs. Calvin Coolidge, King George V, Gen. John J. Pershing, and Benito Mussolini.

LATACUNGA, lä-tä-kōng'gä, Ecuador, capital of Cotopaxi province, located 25 miles from the great volcano Cotopaxi, and has been damaged repeatedly by earthquakes. It is about 50 miles south of Quito on the Qyayaquil-Quito railroad and is a manufacturing center of woolens and cottons. Pop. (1938 est.) 17,800.

LATAKIA, lä-tä-kē'a, Syria, seaport town opposite the island of Cyprus and located 75 miles north of the town of Tripoli. Seleucus Nicator originally named it Laodicea ad Mare in honor of his mother; in the Roman period it was known as Julia. It was the seat of an ancient bishopric and was a wealthy city at the time of the Crusades. Establishment of the tobacco trade in the 17th century gave new life to the city, and tobacco-raising is still the chief industry. Pop. (1943) 36,687.

LATE GEORGE APLEY, The, a novel by John P. Marquand (q.v.), published in 1937, with the subtitle, *A Novel in the Form of a Memoir*.

When George Apley died in Boston, his son John requested an historian (John called him "a compiler of distinguished pasts") to assemble his father's letters and papers into a memoir which would have a family circulation of 15 copies. From these documents emerges a portrait of George Apley, who once said of himself: "I am the sort of man I am, because environment prevented my being anything else."

John Marquand gives an excellent description of that environment. George Apley came from a Boston family who moved from South End to Beacon Hill because his father had seen a neighbor outdoors in his shirt sleeves. He was educated at Mr. Hobson's private school, Harvard College, and Harvard Law School. He made the conventional young gentleman's tour of Europe, attended by an elder aunt and uncle. When George complained that "instead of gaining much impression of different cultures, we have succeeded in transferring our own culture momentarily upon every place we visited," his uncle said: "Find a Bostonian and you will find a citizen of the world."

George Apley married Catharine Bosworth, a Boston girl of whom his parents approved wholeheartedly, and lived the quiet, uneventful life of lawyer, husband, father, and model gentleman. He was not a prude, although he unwillingly

ingly accepted the social changes that were taking place around him. He once wrote in a letter to his son John: "There are certain duties one cannot escape." George was a member of the Browsers' Club where he read papers on such topics as "Adventures in Reform" and "Jonas Good and Cow Corner." He had civic responsibilities with the Boston Waifs' Society and the Apley Sailors' Home. His life was filled with other worries: the removal of a Damask rose bush; the exhumation of Cousin Hattie Apley; his daughter's knowledge of Sigmund Freud; and the disposition of his grandmother's locket which contained his grandfather's hair. As an old man he made another trip to Europe; this time he wrote: "Rome is really a delightful place, particularly when one brings one's own group with one."

John Marquand's picture of a Bostonian's life between 1866 and 1933 is satiric but very understanding. *The Late George Apley* was awarded the Pulitzer Prize for fiction in 1938 and was successfully dramatized for the stage by Marquand and George S. Kaufman.

LATERAN, palace and church at Rome, the name being derived from Plautius Lateranus, whose estates were confiscated by Nero. The palace was given to Pope Melchisedes in 312 by Constantine and was the residence of popes for a thousand years. The Lateran basilica is the cathedral of Rome and the highest ranking church of the Roman Catholic Church.

LATERAN COUNCILS, five ecumenical councils of the Roman Catholic Church, held in the church of Saint John Lateran, Rome, under the presidency of the Pope. The first Lateran Council, attended by 300 bishops, took place in 1123, under Calixtus II. The Concordat of Worms (the agreement between the emperor and the Pope) was confirmed; the indulgences granted to the Crusaders by Urban II were renewed; the consecrations performed by Burdin, the anti-pope, were annulled; the decrees against simony, marriage of the clergy, etc., were repeated. The second (1139), under Innocent II, attended by 1000 bishops, laid the interdict upon King Roger of Sicily, excommunicated the Petrobrusians, and ordered Arnold of Brescia to keep silent. The third (1179), under Alexander III, decreed that a vote of two-thirds of the total conclave should be required legitimately to elect a pope. The fourth, convened by Innocent III in 1215, is the most important of all the Lateran Councils. Besides representatives of many princes, two Oriental patriarchs were present, 412 bishops and 800 abbots and priors. Seventy decrees were issued. The first, directed against the Cathari and Waldensians, contains a confession of faith, in which the term *transubstantiation* occurs for the first time. The second decides the Trinitarian controversy between Petrus Lombardus and Joachim of Floris (in favor of the former). The 13th forbids the foundation of new monastical orders. The 21st decrees that all the faithful shall confess at least once a year to his sacerdos proprius (Mansi xxii 953-1086). The fifth (1512-17), which was convened by Julius II and continued in 1517 under Leo X, and was not recognized by the Gallican Church, abrogated, on the command of Julius II, the Pragmatic Sanction issued by the Council of Pisa, and approved the con-

cordat between Francis I of France and the Pope by which the "liberties" of the Gallican Church were abrogated. Consult Valentini, 'Basilica Lateranense descritta ed illustrata' (1839); Buddeus, 'De Conciliis Lateranensibus,' Jena (1725); von Kefelé, 'Concilien-geschichte' (9 vols., Freiburg 1855-90).

LATERITE, a highly ferruginous, argillaceous rock or soil, found in India. The laterite of the highlands results from the weathering of the underlying volcanic rocks in situ. "Low-level laterite" is the surface-rock of the extensive low lands near the western coast; is formed from the debris of volcanic rocks of the region and of highland rocks. True laterite is a mixture of ferric hydroxide and aluminum hydroxide, with a small amount of free silica. It differs from true clay, in that the aluminum is present as a hydroxide, instead of as the silicate, kaolinite. Laterite is sometimes rich enough in iron to constitute an ore of that metal.

LATEX. The name, Latex, was first applied to certain plant juices which have a white, milky appearance. The white juice of the common milkweeds (*Asclepias*) is a familiar and typical example. The application of the name was then extended to cover similar juices which lack the whitish appearance, like the colorless, slimy juice of the Spider Lily (*Tradescantia*).

The latex is contained in cells which are often remarkable for their length and complexity. In many families of plants, like the *Asclepiadaceæ* (Milkweeds) and *Euphorbiaceæ* (Spurges), the latex cells are differentiated early in the development of the embryo and continue to grow as the embryo develops into the seedling and into the mature plant, and may finally reach a length of many yards. Consequently, they are the longest cells in the plant kingdom. They may branch profusely, but no transverse partitions are formed and, therefore,

FIG. 1.

they are regarded as unicellular vessels. A portion of a single latex cell is shown in Fig. 1.

The walls of latex cells are generally smooth and thin and more or less elastic. During growth, they weave in and out among

the other cells but do not penetrate them. A small portion of a latex cell surrounded by other cells is shown in Fig. 2.

FIG. 2.

Not all of the latex carrying structures are formed in the way just described, for the partitions in rows of cells may become dissolved, so that long vessels are formed, the process being like that involved in the formation of the woody vessels which carry ordinary sap. Whether formed from a single cell or from rows of cells by the breaking down of partitions, long continuous tubes are developed. If there were any transverse partitions, they would interfere with the free flowing of the latex.

The contents of the latex tube or vessels are as varied as the plants which contain them. There is a rather thin layer of protoplasm lining the wall and containing many nuclei and various inclusions, while the hollow part of the vessel contains most of the latex. The consistency of the latex varies, but it is usually a milky sap which flows easily. It contains mixtures of gums and resins, rubber, fat and wax in emulsion. Sometimes there are tannins, salts, ferments and poisonous alkaloids. In the *Euphorbiaceæ* there are also starch grains. Rubber is such an important form of latex that it is treated under its own heading. The great *Euphorbia* trees of South Africa, when cut into with an ax, exude great quantities of a sticky, milky latex which might be of commercial importance.

When a plant containing latex is injured, the latex flows out and quickly coagulates as it is exposed to the air. The latex of *Euphorbia splendens*, a plant very common in the cactus rooms of greenhouses, will pull out into threads as fine as cobwebs, within a minute from the time the cut is made; but in such a small plant the elastic material is not in sufficient quantity to be of any commercial value. In some plants, especially in the flower clusters, the latex tubes are very close to the surface and the tissue covering them is very thin and delicate, so that creeping insects break through

and are held by the rapidly coagulating latex and thus prevented from reaching the nectar, which is reserved for flying insects which can effect cross-pollination. Consult Molisch, H., 'Studien über den Milchsaft und Schleimsaft der Pflanzen' (1901). Various textbooks on botany have paragraphs on latex.

CHARLES J. CHAMBERLAIN.

LATHAM, lä'thām, John, English ornithologist: b. Eltham, 27 June 1740; d. Winchester, 23 Aug. 1837. He studied anatomy under Hunter, engaged in the practice of medicine at Dartford, and in 1796, upon inheriting a fortune, retired in order to devote his time to nature study. He was elected to the Royal Society in 1775, and was active in the establishment of Linnean Society in 1788. He was closely associated with the leading scientific men of his day, and made a notable collection of birds. His last work, the 'General History of Birds,' was written in his ninth decade, and the illustrations were designed, etched and colored by the author. It is his most important work and is referred to by ornithologists as an authority for the assigned names of species. Although Latham has acknowledged faults as a compiler the work is a remarkable achievement. Author of 'A General Synopsis of Birds' (3 vols., 1781-85); 'Index Ornithologicus sive Systema Ornithologiæ' (2 vols., 1790; ed. Johanneau, Paris, 1809); 'General History of Birds' (11 vols., 1821-28), etc.

LATHAM, Robert Gordon, English ethnologist and philologist: b. Billingham, Lincolnshire, 24 March 1812; d. Putney Surrey, 9 March 1888. He was educated at Eton and Cambridge and became professor of English literature in University College, London. He published numerous works on the English tongue, among them 'The English Language' (1841; frequently republished); 'History and Etymology of the English Language' (1849); 'Handbook of the English Language' (1851); 'Elements of Comparative Philology' (1862), and a revised edition of Johnson's Dictionary (1870). His principal works on ethnology are 'Natural History of the Varieties of Man' (1850); 'Man and his Migrations' (1851); 'Ethnology of the British Islands' (1852); 'Ethnology of Europe' (1852); 'Descriptive Ethnology' (1859); 'Russian and Turk' (1878).

LATHROP, lä'thròp, Francis, American decorative artist and portrait painter: b. at sea near the Hawaiian Islands, 22 June 1849; d. Woodcliff, N. J., 18 Oct. 1909. He studied under T. C. Farrar in New York, at the Royal Academy, Dresden, in 1868, and in 1870-73 under Madox Brown in London, and assisted William Morris, Spencer Stanhope and Edward Burne-Jones in the execution of various works. He returned to New York in 1873 and engaged in decorative painting, portraiture and stained glass work. His chief decorative works are in the Metropolitan Opera House, New York; Trinity church and the Bijou Theatre, Boston; and in the chapel at Bowdoin College, Brunswick, Me. His work also appears in many private residences in New York, Albany and Baltimore. Of his stained glasses notable examples are those of the Marquand Memorial in Princeton College chapel, and in Bethesda church, Saratoga

He was one of the founders of the Society of American Artists and an associate of the National Academy of Design.

LATHROP, George Parsons, American author: b. Oahu, Sandwich Islands, 25 Aug. 1851; d. New York, 19 April 1898. He was educated in New York and in Dresden, studying in the latter city from 1867 to 1870, when he returned to New York and for a short time studied law. He went to England and there, in 1871, married Rose, second daughter of Nathaniel Hawthorne. (See **LATHROP, ROSE HAWTHORNE**). From 1875 to 1877 he was assistant editor of the *Atlantic Monthly*; editor of the *Boston Courier* till 1879; resided afterward at Concord, Mass., and in New York. Among his writings in prose and verse the following are best known: 'Rose and Roof-Tree,' poems (1875); 'Study of Hawthorne' (1876); 'Afterglow,' a novel (1876); 'A Masque of Poets' (1877); 'An Echo of Passion' (1882); 'In the Distance' (1882); 'Spanish Vistas' (1883); 'History of the Union League in Philadelphia' (1883); 'Newport' (1884); 'Gettysburg, a Battle Ode' (1888); 'Dreams and Days,' verses (1892); 'Gold of Pleasure' (1892). With his wife he published 'Annals of Georgetown Convent' and 'A Story of Courage' (1894), and he brought out an edition of Hawthorne's works, with a biography (1883). The American Copyright League was founded (1883) by Lathrop.

LATHROP, John (also **LATHROP, LAYTHROP**), American clergyman: b. Yorkshire, England; d. 1653. He was educated at Oxford; took holy orders; was rector at Egerton in Kent; and about the year 1624, in London, became minister (succeeding Henry Jacob) of the first Independent and Congregational church organized in England. He and his congregation underwent annoyance and persecution at the hands of churchmen, and for a time (1632-34) Lathrop was imprisoned. During his confinement he was bereft by the death of his wife and by a division in his flock over a question of baptism, and in 1634 sailed to Massachusetts, where he settled as minister at Scituate, removing in 1639 to Barnstable. The records of these towns kept in "an original register" written by him are referred to as authority by Prince in his 'Annals of New England.'

LATHROP, John Hiram, American educator: b. Sherburne, N. Y., 22 Jan. 1799; d. Columbia, Mo., 2 Aug. 1866. He was graduated at Yale in 1819; from 1822 to 1826 was tutor there; adopted the profession of law, which he followed for six years, then abandoned it for that of teaching. He taught at Norwich, Vt., and at Gardiner, Me. Between 1829 and 1840 held professorships of mathematics, natural philosophy, law, history and economics at Hamilton College; was president of the University of Missouri 1840-49; afterward became chancellor of the University of Wisconsin (1849-59); president of Indiana University (1859-60); professor of English literature at the University of Missouri (1860-62). He was again president of the University of Missouri in 1865, and until the time of his death.

LATHROP, Julia Clifford, American social worker: b. Rockford, Ill., 1858. She was

graduated from Vassar College in 1880 and from 1889 spent much of her time as a voluntary resident at Hull House, Chicago. She specialized in the study of the care of the insane, the education of children and in the development of juvenile courts, and made several tours abroad for the study of methods obtaining in other countries. She served on the Illinois State Board of Charities, was president of the Illinois Society for Mental Hygiene, vice-president of the Chicago School of Civics and Philanthropy, and was appointed the first chief of the new Children's Bureau in the Department of Labor at Washington. She wrote reports and articles on care of the insane, civil service, and of 'The Children's Bureau' (1912). D. 15 April 1932.

LATHROP, Rose Hawthorne, American author: b. Lenox, Mass., 20 May 1851; d. Hawthorne, N. Y., 9 July 1926. She was educated in the public schools, and lived, in 1853-60, in England, where her father, Nathaniel Hawthorne (q.v.), was United States consul at Liverpool (1853-57), and in Portugal; studied art in Dresden and London; and in 1871 married George Parsons Lathrop, with whom, until his death, she was associated in literary labors. She was especially interested in the improvement of conditions for suffering and needy people, and in 1891 established Saint Rose's Free Home for Cancer, and Rosary Hill Home, in New York, where she afterward became head of a Dominican community of the Third Order and directress of a charitable home, her title being Mother Mary Alphonsa. Besides many sketches and stories, her writings include 'Along the Shore,' poems (1888), and 'Memories of Hawthorne,' with her husband (1897), with whom she also collaborated in other works.

LATHROP, William Langson, American painter: b. Warren, Ill., 29 March 1859. He was self-taught in art and has devoted himself to landscape painting. He was awarded the gold medal of the Philadelphia Art Club, won the Webb and W. T. Evans prizes, and was also awarded prizes from the Carnegie Institute and Worcester, Mass. His work is represented in the permanent collections of the Metropolitan Museum of Art, New York; the Carnegie Institute, Pittsburgh; the Albright Gallery, Buffalo; the National Museum of Art, Washington; and the Minneapolis Art Museum. He was elected to the National Academy in 1907.

LATHYRUS, *lath'ë-rûs*, a genus of plants of the family *Leguminosæ*, the vetchlings or everlasting peas, which resemble *Vicia* but have usually fewer leaflets (often two), broader petals, an obliquely truncate staminal tube, and a style longitudinally flattened and bearded on the inner face. The species are numerous and grow in sandy and waste places, or in meadows. *L. pratensis*, the meadow vetchling, a climbing plant, two or three feet long, with yellow flowers, is a familiar example in many parts of the northern hemisphere. Another species (*L. maritimus*) the beach-pea, is equally widespread. The roots of *L. tuberosus* are eatable. *L. sativus* and other species are used as green fodder for cattle in India, but are harmful to pigs; and several species contain a poisonous principal injurious to the human system. *L. latifolius* and *L. sylvestris*, of southern Europe

and England, respectively, are both perennials and known as the everlasting pea. *L. odoratus*, a native of the East, is a common flower garden plant, with fragrant flowers. *L. sylvestris wagneri* is grown as a fodder plant in Germany, France and the United States. It yields abundant green forage and when well started is very resistant to drought. Nearly 60 species of the genus are cultivated for their handsome flowers—yellow, red, scarlet, purple and blue. The larger kinds are well adapted for arbors and shrubberies, where they may climb upon some support.

LATIMER, Hugh, English prelate, reformer and martyr: b. Thurcaston, Leicestershire, about 1490; d. Oxford, 16 Oct. 1555. He was educated at Cambridge, took holy orders, and by and by began to preach Protestant doctrine, which led to vigorous opposition. As one of the representatives of the University of Cambridge, he supported Henry VIII's doubts on the validity of his marriage with Catharine of Aragon; was made chaplain to the king in 1530, and bishop of Worcester in 1535. In 1539 he resigned his bishopric, not being able to accept the Six Articles, and was put in prison, but on the accession of Edward VI he was released and became highly popular at court. This continued until Mary ascended the throne, when Latimer was cited to appear, with Cranmer and Ridley, before a council at Oxford, and condemned. After much delay and a second trial Latimer and Ridley were burned at the stake. His dying words are famous: "Be of good cheer, Master Ridley, and play the man; we shall this day light such a candle by God's grace in England as (I trust) shall never be put out." His preaching was popular in his own time for its pith, simplicity and quaintness, and his 'Sermons' are still read. Consult *Lives* by Demaus (1869); R. M. Carlyle (1899).

LATIMER, James Elijah, American clergyman and educator: b. Hartford, Conn., 7 Oct. 1826; d. Auburndale, Mass., 26 Nov. 1884. He was graduated at Wesleyan University in 1848 and engaged in teaching until 1861 when he became pastor of the Methodist Episcopal church at Elmira, having entered the ministry in 1858. He traveled in Europe in 1868 and in 1870 he was selected as professor of historic theology in the Boston University School of Theology. In 1874 he was appointed dean and professor of systematic theology there, which positions he retained the remainder of his life. He was a contributor to magazines and religious periodicals.

LATIN, The Mechanism of. Under this heading it is proposed to give a brief description of the morphology of Latin with a few preliminary remarks on the Latin alphabet.

1. **The Alphabet.**—Originally and even up until Cicero's time, the Latin language had only 21 characters to represent its sounds. Toward the end of the republic or the beginning of the empire the letters Y and Z were introduced from the Greek alphabet in Greek loanwords, so that at this time there were 23 characters in Latin (6 vowels and 17 consonants), as follows:

ABC DEF GHI KLM NOP
QRS TU (V) XYZ

The 9th and 20th characters, however, had consonantal as well as vocalic values. Unlike the Greek, the Latin alphabet was not borrowed directly from the Phœnician, but through the medium of the Greek alphabet of the Doric-Chalcidian colony of lower Italy.

2. **The Parts of Speech.**—In Latin there are the following parts of speech: noun (which includes substantives and adjectives), pronoun, verb, adverb, preposition, interjection and conjunction. Numerals are considered as adjectives or adverbs accordingly as they are cardinals or ordinals. Participles partake of the nature and functions of both the adjective and the verb. Words which undergo a change in form to indicate a change in meaning are said to be inflected. The last four parts of speech mentioned above are uninflected. The inflection of nouns and pronouns is called declension; that of verbs, conjugation.

3. **Gender, Number and Case.**—In Latin one and the same nominal form indicates simultaneously gender, number and case without any of these categories having a distinctive mark.

A. *Gender.*—There are three genders in Latin: masculine, feminine and neuter. It is difficult, however, to foretell a priori what would be the gender of a given word. In general, masculine and feminine mark a difference of sex, and neuter denotes inanimate objects, but there is also a grammatical gender which must not be confused with the natural gender.

B. *Number.*—Latin distinguishes two numbers: singular and plural. The dual, which in Indo-European served to designate two objects, has completely disappeared, although there are traces of some dual forms, such as *duo* and *ambo*, which however are treated as plurals.

C. *Case.*—Latin possesses six cases: nominative, genitive, dative, accusative, vocative and ablative. The ablative was formerly a local case and with it is confused a case primitively distinct, the instrumental or case of accompaniment and of means. There are also some traces of a locative case, now lost. The use of prepositions with some of the cases supplies some deficiencies of the mere cases in expressing word relationship. The functions of the cases are as follows:

nominative	case of subject or of predicate attribute
genitive	case of complement of noun, whether subjective or objective
dative	case of person or thing interested
accusative	case of direct complement of verb; of extent of space and duration of time; of limit of motion
vocative	case of direct address
ablative:	
real ablative	case of point of departure or origin
instrumental ablative ..	case of means, instrument, manner and accompaniment
locative ablative (in part)	case of place in which
locative	case of time at which or place in which

It is characteristic of Latin that from the very beginning there is a tendency to reduce the number of cases. In the singular the instrumental has disappeared, the locative has only a precarious existence and the vocative and nominative tend to be confused. In the plural Latin never had but one form for the dative, ablative, instrumental and locative, not to mention the single form for the nominative and vocative, whose identity goes back to the Indo-European.

4. The Noun.—Variation of accent plays no part in the declension of Latin nouns, for since prehistoric times Latin had an accent at SINGULAR.

The declension of neuter nouns differs a little from the paradigm below in the nominative, vocative and accusative cases, which in the plural always end in -a.

5. Pronouns.—Pronouns in Latin fall into five chief classes: personal (including possessives), demonstrative, relative, interrogative and indefinite. Although in many respects pronouns do not differ to a great extent from nouns in declension, they have essential characteristics which show clearly that they have their own declension. This is particularly true of personal pronouns whose declension is therefore given here:

nominative	ego	tū	(demonstrative)	nōs	vōs	(demonstrative)
genitive	mei	tui	sui	nostrum, nostri	vestrum, vestri	sui
dative	mihi	tibi	sibi	nōbis	vōbis	sibi
accusative	mē	tē	sē, sēsē	nōs	vōs	sē, sēsē
ablative	mē	tē	sē, sēsē	nōbis	vōbis	sē, sēsē

a fixed place, and the displacements of the Indo-European movable accent, of which some traces are found in Greek, have entirely disappeared in Latin. Moreover, the Indo-European variation of the quality or quantity of stem-vowels, a phenomenon called ablaut or vowel gradation, which is not preserved intact in any one language, leaves but few traces in Latin. The Indo-European noun was composed of a stem, to which was added an ending which, concurrently with the vocalic variations of the stem, marked at once the number, gender and case. Since the vocalic variation of stem was almost entirely eliminated in Latin, Latin declension is to be recognized by the endings. The Latin grammarians laid down five types of declension according to the relation between the nominative and genitive:

	1	2	3	4	5
nom.	rosa	dominus	dux mens classis	manus	diēs
gen.	rosae	domini	ducis mentis classis	manūs	diēi

This distinction is very artificial, although it is always taught. The following paradigm shows the case-endings of the five declensions:

	1	2	3	4	5
nominative	rosa	dominus	dux mens classis	manus	diēs
genitive	rosae	domini	ducis mentis classis	manūs	diēi
dative	rosae	dominō	duci menti classi	manui	diēi
accusative	rosam	dominum	ducem mentem classem	manum	diem
vocative	rosa	domine	dux mens classis	manus	diēs
ablative	rosā	dominō	duce mente classe	manū	diē

PLURAL.

nominative & vocative	rosae	domini	ducēs	mentēs	classēs	manūs	diēs
genitive	rosarum	dominorum	ducum	mentium	classium	manuum	diurum
dative & ablative	rosis	dominis	ducibus	mentibus	classibus	manibus	diibus
accusative	rosās	dominōs	ducēs	mentēs	classēs	manūs	diēs

distinguishes personal and non-personal forms. The former, which are the more important, comprise the tenses and moods provided with personal endings; the latter, declinable or indeclinable forms which by their origin and their morphology are attached to the substantive.

Personal forms comprise three moods: indicative, or mood of reality or affirmation; imperative, which serves to give orders; and subjunctive, or mood of subordination, which marks will and anticipation and in Latin also wish, possibility and condition. Each of the stems has three tenses in the indicative: present, imperfect or past, and future; the imperative has no past and the subjunctive no future or future perfect. Each of these tenses has two numbers: singular and plural; there is no dual. Each of these numbers has three persons: first, second and third (except the imperative which has not the first).

Non-personal forms comprise: *a*, verbal substantives: infinitive (present and perfect in the two voices), gerund and supine, which form a sort of declension of the active infinitive; and *b*, verbal adjectives: participles (present and future active, perfect and future passive).

Latin has not merely one conjugation, but it is difficult to find a satisfying classification. The distinction into four conjugations, imagined by the Latin grammarians and still in use in the teaching of Latin, takes into account only the present and even here unites two different formations. In the perfect it is even altogether improper. But the division into thematic and non-thematic or athematic verbs is equally unsatisfactory. The four conjugations now generally adopted in teaching are those whose stem ends in *-ā* (first conjugation), *-ē* (second conjugation) and *-ī* (fourth conjugation), together with the third conjugation which includes, among others, all those verbs whose stem ends in a consonant and requires a thematic vowel to join it to the personal or tense endings. There are quite a few verbs which do not fit

into these artificial categories, such as *sum* ("I am"), *volo* ("I wish"), *fero* ("I bear"), etc.

The personal endings of all the tenses (indicative and subjunctive) in the active voice except the perfect indicative are:

Person.	Singular.	Plural.
1	-ō or -m	-mus
2	-s	-tis
	-t	-nt

The personal endings of all the tenses (indicative and subjunctive) of the present stem in the passive and in deponents are:

Person.	Singular.	Plural.
1	-r	-mur
2	-ris or -re	-mini
3	-tur	-ntur

The personal endings of the perfect indicative tense in the active are:

Person.	Singular.	Plural.
1	-i	-imus
2	-isti	-istis
3	-it	-erunt, -ere

The personal endings of the tenses (indicative and subjunctive) of the perfect stem in the passive and in deponents are formed by the participle and the auxiliary verb.
